

I need to set up an airtable for the cosmic council to keep track of all of the data it is trained on for each round of iterations throughout the perpetual workflow

To set up an Airtable for the Cosmic Council's perpetual workflow, each round of data needs to be captured across the six interconnected stages or "segments." The table should reflect both the cyclical nature and the unique focus of each stage, supporting the tracking of tasks, insights, feedback, and resource management through each iteration. Here's a foundational structure for the Airtable:

Suggested Airtable Table Structure

Table Name: Cosmic Council Iterative Workflow

Fields:

Iteration ID (Single Line Text): Unique identifier for each cycle or round, such as "Cycle-001."

Date Started (Date): Start date of the iteration cycle.

Date Completed (Date): Completion date for each round.

Status (Single Select): Dropdown for tracking current progress, e.g., "In Progress," "Completed," "Pending Review."

Cycle Insights (Long Text): Summary of insights or major takeaways for each completed cycle.

Feedback Loop (Checkbox): Marks if feedback has been integrated from the Purple Triangle (Support & Empathy) to prepare for the next cycle.

Stage-Specific Fields: Each stage should have fields dedicated to its unique functions within the workflow:

Red Triangle - Research & Inquiry

Research Notes: (Long Text) Key research findings or data relevant to the cycle.

Primary Questions: (Long Text) Root cause questions or guiding questions developed.

Orange Triangle - Planning & Logistics

Plan Outline: (Long Text) High-level action plan or logistics outline.

Dependencies: (Linked Record) Connects to other tasks or resources from previous cycles if applicable.

Yellow Triangle - Development & Creativity

Prototype / Experiment Details: (Attachment) Includes files or visuals related to the prototype or experiment.

Innovative Ideas: (Long Text) Brainstormed ideas or novel concepts.

Green Triangle - Budget & Resources

Budget Allocation: (Currency) Budget allotted for this cycle.

Resources Used: (Single Line Text) Lists of resources or tools required.

Blue Triangle - Marketing & Communication

Target Audience: (Single Line Text) Audience or stakeholder focus for this cycle.

Communication Strategy: (Long Text) Summary of strategies or messages planned.

Purple Triangle - Support & Feedback

Feedback Collected: (Long Text) Summarizes feedback collected from users, stakeholders, or internal reviews.

Continuous Improvement Notes: (Long Text) Notes on how feedback will inform the next cycle or iteration.

Reference Resources

Guiding Texts (Linked Record): Links to relevant chapters, teachings, or principles from the Cosmic Council, ensuring a holistic understanding is maintained across cycles.

This setup will provide a structured but flexible framework for capturing both structured data and qualitative insights, supporting the continuous, cyclical improvement of the Cosmic Council's decision-making process. For enhanced tracking, you could also integrate a dashboard view to visualize the interconnected stages as a dynamic flow.

You said:

I dont need one table I need a whole database with multiple tables

ChatGPT said:

Here's how you can design a multi-table Airtable database for the Cosmic Council, aligning with its cyclical and interconnected workflow. This setup ensures that each table represents a key part of the iterative process while enabling cross-references between stages and cycles for holistic tracking.

Suggested Airtable Database Structure

1. Master Cycles Table

Purpose: To record and manage high-level details of each iterative cycle.

Fields:

Cycle ID (Primary Field): Unique identifier for each cycle, e.g., "Cycle-2024-Q1."

Date Started (Date): Start date for each cycle.

Date Completed (Date): Completion date for the cycle.

Status (Single Select): Dropdown with options like "In Progress," "Reviewing," "Completed."

Summary Insights (Long Text): Overall insights or achievements from each cycle.

Stage Completion (Linked Record to "Stages Table"): Tracks progress on each of the six stages in the cycle.

Key Feedback (Linked Record to "Feedback & Improvement Table"): Links to core feedback items for continuous improvement.

2. Stages Table

Purpose: To capture specific actions, outputs, and insights for each of the six stages of the Cosmic Council workflow within a given cycle.

Fields:

Stage ID (Primary Field): Unique identifier for each stage within a cycle, e.g., "Cycle-2024-Q1-Red-Owl."

Stage Name (Single Select): The six stages (e.g., "Red Triangle – Research," "Orange Triangle – Planning," etc.).

Cycle Link (Linked Record to "Master Cycles Table"): Links the stage to its respective cycle.

Primary Actions (Long Text): Overview of actions taken in this stage.

Stage Insights (Long Text): Key findings or outcomes specific to this stage.

Stage Resources (Linked Record to "Resources Table"): Links to resources used in this stage.

Next Stage Prep (Checkbox): Marks if this stage's insights are ready for the next stage.

3. Resources Table

Purpose: To manage and catalog resources, tools, and budget allocations needed for each cycle.

Fields:

Resource ID (Primary Field): Unique identifier, e.g., "Res-001."

Resource Type (Single Select): Type of resource, e.g., "Financial," "Research Material," "Human Resource."

Resource Description (Long Text): Detailed description of the resource.

Budget Allocation (Currency): Cost associated with each resource.

Used In (Linked Record to "Stages Table"): Links each resource to the specific stage where it was used.

Status (Single Select): Options such as "Available," "Reserved," "Used."

4. Feedback & Improvement Table

Purpose: To store feedback gathered during each cycle and notes on how it will inform future iterations.

Fields:

Feedback ID (Primary Field): Unique identifier, e.g., "FB-2024-Q1-01."

Feedback Source (Single Select): Origin of feedback, e.g., "Internal Review," "External Stakeholder," "User Feedback."

Cycle Link (Linked Record to "Master Cycles Table"): Links feedback to the cycle where it was gathered.

Feedback Summary (Long Text): Description of feedback.

Improvement Actions (Long Text): Specific changes planned in response to the feedback.

Stage Impacted (Linked Record to "Stages Table"): Indicates the stage(s) affected by this feedback.

5. Knowledge Base Table

Purpose: A repository of key concepts, guiding principles, and insights from the Cosmic Council's texts to ensure the process is informed by foundational knowledge.

Fields:

Knowledge ID (Primary Field): Unique identifier, e.g., "KB-Red-Owl."

Stage Linked (Linked Record to "Stages Table"): Links the knowledge base entry to specific stages where it applies.

Core Concept (Long Text): Summary of the principle or teaching.

Related Insights (Long Text): Notes or insights tied to this concept.

Resource Link (Attachment or URL): Links to the Cosmic Council texts or documents for reference.

6. Interactions Table

Purpose: To record and manage the interaction between the six stages in each cycle, reflecting the flow of insights and dependencies.

Fields:

Interaction ID (Primary Field): Unique identifier, e.g., "Inter-Cycle-2024-Q1-RedToOrange."

From Stage (Linked Record to "Stages Table"): The starting stage of the interaction (e.g., Red Triangle).

To Stage (Linked Record to "Stages Table"): The subsequent stage receiving the insights or outcomes.

Description of Interaction (Long Text): Notes on what was transferred or how the stages influenced each other.

Feedback Loop (Checkbox): Marks if feedback from a later stage led to an adjustment in an earlier stage.

Workflow Overview

In this setup:

Master Cycles Table serves as the central hub to monitor overall progress, start and end dates, and cycle-level insights.

Stages Table organizes work at each stage, linking back to the Master Cycles, Resources, and Feedback tables for detail.

Resources Table provides financial tracking and links resources to specific stages.

Feedback & Improvement Table centralizes feedback management, linking it to the affected cycles and stages.

Knowledge Base Table ensures each stage is informed by core teachings, providing easy access to guiding principles.

Interactions Table captures the dynamic flow of insights and feedback between stages, ensuring a smooth cyclical progression.

This structure facilitates a continuous loop of improvement and enables tracking insights at multiple levels, keeping each cycle aligned with the Cosmic Council's holistic, system-based approach.

You said:

Start over ask me questions about how the process will work before you start planning

ChatGPT said:

Alright! Let's begin by clarifying the structure and flow of your Airtable database based on how you envision the Cosmic Council's iterative workflow. Here are some key questions to guide the planning process:

1. High-Level Structure and Workflow

What is the main objective of the database? Is it primarily to track data flow across each stage, monitor progress, collect insights, or something else?

How do you envision the cyclical nature of the workflow being captured? Should the database reflect continuous iterations in one seamless cycle, or do you want separate records for each new iteration round?

2. Stages and Segments

Do each of the six segments (stages) have distinct types of data, actions, or outputs? For example, does the Red Triangle's research stage differ significantly in what it needs to track compared to, say, the Blue Triangle's marketing stage?

Would you prefer to see each stage as its own table, or should they be part of a larger table where all stages can be seen together?

3. Data Collection and Types

What specific data should be collected at each stage? For example, insights, tasks, resources used, budget allocation, feedback collected, and so on.

Is there any data that will need to be referenced or linked across multiple stages? For instance, resources, insights, or feedback that applies across several segments.

4. Tracking and Reporting

How do you want to track progress through each iteration? Should there be indicators for "In Progress," "Completed," "Pending," or similar statuses for each segment within a cycle?

What types of insights or feedback need to be recorded and carried forward into subsequent cycles? Are there specific feedback loops or key learnings you want to track?

5. Knowledge Integration

Would you like to integrate teachings and principles from the Cosmic Council as a reference resource within the database? For example, linking each segment to relevant guiding principles or documentation.

Do you envision a need to track changes or evolution in understanding from one iteration to the next based on new insights?

6. Roles and Access

Who will be using this Airtable? Will different roles have unique functions, such as reviewing stages, providing insights, or handling feedback?

Would certain users need restricted access to some parts of the data?

Answering these questions will help create a tailored, efficient, and effective Airtable database for tracking the Cosmic Council's process. Feel free to answer or elaborate on any other ideas you have about how this should work!

You said:

1. The main purpose of the database is to store all of the protocols for how the workflow will function. By connecting an API of OpenAi and using multiple assistants (agents) to play the role

of each of the cosmic council members in various stages of the process, for example: when in the research stage, there will be 6 agents that work within it, mirroring the structure of the cosmic council (much like a microcosm of the cosmic council that only focuses on developing the most effective and complete response for each triangle, like a hexagon inside of each triangle. By using a database, like airtable, we can offload the data generated from each iteration, keep track of everything and pass the information to the next assistant without losing track of where the last agent left off. Does this make sense? Im having a hard time explaining. ChatGPT said:

Yes, that makes sense! You're creating a nested, iterative workflow where each Cosmic Council segment not only operates in sequence but also houses its own "micro-council" of agents dedicated to that specific stage. Here's how I'm interpreting your vision:

Database as a Protocol Repository: The primary function of the database is to store all protocols and rules for how the workflow operates at both the macro and micro levels. It will contain the processes and specific tasks for each stage, so that agents know exactly what to do and where to pick up when they enter the workflow.

Microcosmic Structure: Each stage (e.g., Research, Planning, Development) mirrors the Cosmic Council's hexagonal structure internally, with six agents collaborating to develop a comprehensive output for that specific stage. These agents bring their unique perspectives or roles to the work within their assigned triangle.

Data Flow and Continuity: By offloading data to Airtable, agents can pass information seamlessly between stages, ensuring that outputs, insights, and partial work from each agent and stage are accessible to the next set of agents. This structure prevents any loss of information and maintains continuity across iterations.

This gives a clear foundation. Now, let's break down additional questions to refine the database's structure and contents:

1. Data Flow Between Stages and Agents

What specific data or protocols does each agent need from previous stages? For instance, would the agents in the Research stage only need access to prior cycles of Research data, or do they also need to review insights from Planning, Development, etc.?

Will agents add multiple types of data to each stage? For example, structured protocols (like a checklist), qualitative insights (summaries or notes), or quantitative data (metrics or scores)?

2. Microcosmic Agent Roles

Are each of the six agents within a stage distinct in their function, and if so, what roles do they play? For instance, within the Research stage, do agents handle specific areas such as "Data Collection," "Analysis," and "Reporting," or do they collaborate uniformly?

Is there a process for consolidating the six agents' work within a stage before moving to the next one? Should their output be merged into a final summary, or is each agent's contribution passed on individually?

3. Protocol Specifics and Iterative Tracking

What protocols should each stage or agent follow? Would it be helpful to document specific questions, checklists, or criteria that guide the work within each stage?

How will completed iterations be stored or tagged? Should the database archive every step from each cycle for review, or should only the final outputs be retained?

4. Feedback Loops and Refinement

How will feedback be implemented across cycles? Do you want a specific feedback agent or process to evaluate the work from each cycle and apply it directly, or will it be captured in notes for each new stage to reference?

5. API Integration and Automation Needs

What data should the OpenAI API be able to read and write? This can include pulling data (e.g., instructions, context, outputs) from Airtable and saving outputs back into it.

Should agents automatically pass their work to the next stage, or is there a manual review process?

You said:

One question at a time:

What specific data or protocols does each agent need from previous stages? For instance, would the agents in the Research stage only need access to prior cycles of Research data, or do they also need to review insights from Planning, Development, etc.?

Check your training data in your knowledge base for this answer and check with me if you understand it correctly

ChatGPT said:

Each stage of the Cosmic Council's workflow relies on interconnected, cyclical data transfer and feedback, with each agent in a stage receiving and building upon outputs from earlier stages. Here's a breakdown of data requirements and dependencies for each stage:

Research Stage (Red Owl):

Primary Data Requirements: Foundational knowledge, background information, and previously identified core questions from earlier cycles or related stages.

External Dependencies: While agents in this stage primarily focus on new inquiries, they need insights from prior Planning (Orange) and Development (Yellow) stages if those stages have identified emerging research gaps, technological considerations, or user needs that research must address. This ensures the research phase remains relevant and goal-oriented.

Planning Stage (Orange Orangutan):

Primary Data Requirements: Strategic objectives from Research, especially high-priority questions and themes that guide structured planning.

External Dependencies: Needs insights from past Development (Yellow) and Budgeting (Green) stages, specifically concerning feasibility, resource availability, and logistical constraints identified in earlier iterations. This allows planning to be both innovative and realistic.

Development Stage (Yellow Honeybee):

Primary Data Requirements: Detailed blueprints from Planning, including proposed actions and contingencies.

External Dependencies: Receives significant input from Budgeting (Green) to confirm resource allocations and constraints and from prior Market (Blue) insights to shape prototypes or pilot solutions that align with market expectations.

Budgeting Stage (Green Turtle):

Primary Data Requirements: Full scope and resource needs from Development and Planning, detailing estimated costs, timeline expectations, and required assets.

External Dependencies: Relies on Research to understand baseline data and industry standards, helping in resource allocation decisions. This stage also benefits from feedback loops with the Support (Purple) stage to ensure resource flexibility for evolving demands.

Market Dynamics Stage (Blue Dolphin):

Primary Data Requirements: Prototype results, feedback from Development, and communication strategies developed in the Planning phase.

External Dependencies: Needs continual input from Support (Purple) to stay aligned with stakeholder feedback and maintain responsiveness to market or environmental changes.

Support and Feedback Stage (Purple Elephant):

Primary Data Requirements: User feedback, market response data, and operational performance metrics from all stages.

External Dependencies: Informs and adjusts all stages, as it gathers insights on how well solutions are received and implemented. Feedback is fed directly back to the Research and Planning phases to refine future iterations.

This structure aligns with the principles of interconnected feedback loops and emergent properties within the Council's framework. Each agent's role within a stage is structured to interpret and build upon these data flows, ensuring that outcomes are coherent, comprehensive, and continuously evolving.

You said:

You're getting ahead of yourself. Think about this from step 1. Each Stage only knows the information from the previous stage. It follows the rainbow: ROYGBV.

Red flows into orange, orange into yellow, yellow into green...etc.

The process cascades data, but when it reaches the last stage of support, the data is feedback into the next iteration which will focus on solving a problem that was brought to light during the first round of problem solving.

ChatGPT said:

Got it! Starting from step 1 and keeping the cascading nature in mind:

Each stage only receives data from the stage immediately preceding it in the ROYGBV sequence, with Support (Purple) closing the loop by feeding its insights back to the next cycle, starting again with Research (Red). This linear flow means that each stage builds directly on the output from the one just before it, without jumping ahead to stages further along. When Support feeds back into Research, it introduces any unresolved issues or newly identified challenges as a focus for the next cycle.

So, the database structure should be set up to support this one-directional cascade of data and focus on the unique handoff between each pair of consecutive stages:

Research (Red): Starts with a problem or question to solve and initiates the workflow.

Planning (Orange): Receives foundational research insights directly from Research.

Development (Yellow): Builds on structured plans provided by Planning.

Budgeting (Green): Considers Development's resource needs based on its prototyping or creative output.

Market (Blue): Informs and prepares communication strategies from Budget's financial constraints.

Support (Purple): Gathers feedback on Market's implementation and then identifies areas for refinement or new problems, passing this information back to Research for the next cycle.

With this clear, linear flow in place, let's think about what specific information each stage will generate and pass along to the next, as well as what kind of data Support should feedback into Research for the subsequent iteration. Would you like to discuss the specifics of each stage's output and its relevance to the next?

You said:

Think about this question that you asked me previously:

How do you envision the cyclical nature of the workflow being captured? Should the database reflect continuous iterations in one seamless cycle, or do you want separate records for each new iteration round?

Now that you know how the process works, can you answer this question?

ChatGPT said:

Yes, given the cascading and cyclical nature of this workflow, the database should capture each iteration as a new record in a continuous cycle rather than a single, seamless record that updates indefinitely. Here's why:

Tracking Distinct Cycles: Each cycle represents a full round of problem-solving, starting with an initial inquiry in Research and ending with feedback from Support. By creating separate records for each new cycle, we can preserve the history of every iteration, capturing changes in focus, new issues identified, and the development of solutions over time.

Data Continuity and Feedback Integration: Since Support (Purple) feeds its insights back into the next cycle's Research (Red), creating separate records per iteration allows each new round to inherit and build on the previous one's outputs. Each cycle would effectively pull forward any outstanding issues or new goals from the previous cycle's final feedback stage.

Ease of Analysis and Comparison: Maintaining individual records for each cycle supports a straightforward view of how problems, resources, and solutions evolve from one iteration to the next. This structure will allow for trend analysis over multiple cycles, helping to observe patterns and measure progress.

Automated Data Cascading: With discrete records for each cycle, data from the previous cycle's Support stage can automatically populate the new cycle's Research stage, streamlining the transition from one cycle to the next.

So, the database should create a new set of records for each iteration, with each record linking sequentially to the previous cycle's Support feedback and cascading data through ROYGBV until Support completes the cycle again. This approach maintains a clean, historical log of each problem-solving round, enabling cumulative learning across cycles.

You said:

Excellent. Now, let's focus on this next question. Check your knowledge base for the answer:

Do each of the six segments (stages) have distinct types of data, actions, or outputs? For example, does the Red Triangle's research stage differ significantly in what it needs to track compared to, say, the Blue Triangle's marketing stage?

ChatGPT said:

Yes, each of the six stages indeed has its own unique focus, with distinct types of data, actions, and outputs. Each stage within the Cosmic Council's structure addresses a specific aspect of the problem-solving process, leveraging specialized approaches and outcomes to pass on to the next stage. Here's a breakdown:

Red Triangle (Research & Inquiry): This stage gathers foundational knowledge, analyzing root causes and initial data to define the problem. Here, data types include research findings, root-cause questions, and potential hypotheses. The output is a clarified problem statement and prioritized areas for exploration.

Orange Triangle (Planning & Logistics): At this stage, the focus shifts to structuring a plan based on research insights. Planning involves logistical considerations, resource mapping, and defining tasks, producing outputs like timelines, checklists, and strategy outlines to prepare for development.

Yellow Triangle (Development & Creativity): This stage emphasizes ideation and prototyping, where brainstorming and creative thinking drive the formation of potential solutions. Data collected here may include design notes, test results, and creative drafts. The main output is a working prototype or model for review and refinement.

Green Triangle (Budget & Resource Allocation): Here, resource management and financial planning come into play. This stage deals with budget allocations, cost analyses, and resource requirements, producing outputs such as financial projections, allocation plans, and budget justifications.

Blue Triangle (Market Dynamics & Communication): The focus here is on external communication and market interaction. Key data includes market research, consumer insights, and strategic communication plans. The stage's output is a tailored marketing and engagement strategy, ready to be deployed or tested.

Purple Triangle (Support & Feedback): This stage centers on reflection, feedback collection, and support mechanisms. It tracks user feedback, operational performance, and impact assessments. The main output is a set of recommendations, reflections, and feedback that inform the next cycle of Research, completing the iterative loop as each stage's outputs align with the next stage's data needs, supporting the smooth, cascading transfer of insights throughout the cycle.

You said:

Now, let's address this question:

Will agents add multiple types of data to each stage? For example, structured protocols (like a checklist), qualitative insights (summaries or notes), or quantitative data (metrics or scores)?

By connecting Make.com we will be able to integrate many tools into this workflow so yes there will be multiple types of data.

ChatGPT said:

Since multiple data types are being integrated at each stage, we can structure the database to accommodate a variety of data formats that each agent might contribute. With Make.com integrations, the system can handle everything from structured protocols to qualitative and quantitative data, ensuring comprehensive coverage of each stage's outputs. Here's how we can organize it:

Structured Protocols: For consistency and efficiency, each stage will benefit from structured data entries, like checklists, templates, and standardized fields. These protocols could outline required actions, check for task completion, and confirm adherence to established procedures (e.g., a checklist for Research on sources reviewed or a checklist for Budget on resource allocation steps).

Qualitative Insights: Summaries, reflections, or observational notes gathered from each agent's insights will be essential for capturing the depth and context of each stage. These might include exploratory findings in Research, creative ideas during Development, and anecdotal feedback from Support. Having fields for notes and summaries allows each agent to record subjective insights that structured data alone might not capture.

Quantitative Data: Quantitative fields (e.g., metrics, scores, financial figures, time estimates) are essential for tracking progress and performance. For example:

In the Budgeting stage, fields for cost analysis, budget limits, and financial projections.

In Market Dynamics, tracking KPIs like engagement metrics, customer response rates, or satisfaction scores.

Development might also track iteration counts or the success rate of initial prototypes.

Media Attachments: Certain stages (especially Development and Marketing) might benefit from attaching files, images, or visual resources. This could include design drafts, marketing collateral, or diagrams that add clarity and value to the next stage.

Automated Logs and Summaries: With Make.com, automation can ensure that data from other integrated tools (such as Google Docs for qualitative reports or Google Sheets for numerical data) is compiled directly into Airtable. These integrations will help consolidate agent inputs across diverse tools, capturing each type in the right format.

This multi-layered approach ensures that every agent's contribution—whether it's checklist items, qualitative insights, or hard metrics—is preserved in the database, enhancing continuity

and depth at every stage of the workflow. Would you like to further detail how specific tools (e.g., Google Docs, Sheets, or other platforms) will contribute to each data type?

You said:

We will get there later but first answer this question from your knowledge base:

Do each of the six segments (stages) have distinct types of data, actions, or outputs? For example, does the Red Triangle's research stage differ significantly in what it needs to track compared to, say, the Blue Triangle's marketing stage?

ChatGPT said:

Each stage in the Cosmic Council's hexagonal framework indeed focuses on distinct types of data, actions, and outputs, as they each play a unique role in the cyclical workflow:

Red Triangle (Research & Inquiry):

Data Type: Foundational knowledge, background research, and initial problem definitions.

Actions: Gathering information, analyzing patterns, and understanding root causes.

Outputs: A clarified problem statement and a set of high-priority research questions to guide further stages
Orange Triangle (Planning & Logistics)**:

Data Type: Actionable steps, resource dependencies, and initial logistics requirements.

Actions: Structuring a plan, creating timelines, and setting up operational checklists.

Outputs: A strategic roadmap, detailed timelines, and an organized framework for implementing the solutions identified in the Research stage
Green Triangle (Development &

Creativity)**:

Data Type: Prototype designs, experimental data, and creative solutions.

Actions: Brainstorming, developing prototypes, and iterating on creative ideas.

Outputs: Prototypes or mockups, along with test results or feedback on potential solutions
Yellow Triangle (Budget & Resource Allocation)**:

Data Type: Financial projections, resource allocations, and cost-benefit analyses.

Actions: Budgeting, analyzing financial feasibility, and distributing resources.

Outputs: Budget plans, resource allocation lists, and any constraints on spending or resource availability .

Blue Triangle (Communication):

Data Type: Market insights, consumer behavior data, and marketing content.

Actions: Analyzing market needs, refining messaging, and planning promotional efforts.

Outputs: Communication strategies, targeted marketing plans, and materials for engagement with the intended audience
Purple Triangle (Support):

Data Type: Feedback data, user satisfaction metrics, and support insights.

Actions: Collecting feedback, analyzing user responses, and providing support.

Outputs: Recommendations, refinement goals, and insights for the next iteration, which feed back into the Research stage to inform the next cycle [9:7†source].

Each stage not only contribu output but also aligns with a unique aspect of the problem-solving process, ensuring that the cyclical nature of the workflow remains intact while facilitating a structured transfer of data and insights through each stage in ROYGBV order.

You said:

next lets address this question:

Would you prefer to see each stage as its own table, or should they be part of a larger table where all stages can be seen together?

I would like each stage to have its own table.

ChatGPT said:

Since you'd like each stage to have its own table, here's how we can structure the database to maximize clarity and maintain the necessary connections between stages.

Proposed Structure with Individual Tables for Each Stage

Each stage table can focus on its unique type of data, actions, and outputs while still maintaining a clear link to other stages in the cycle.

1. Research Table (Red Triangle)

Purpose: To store foundational research, inquiries, and questions that define the problem.

Fields:

Research ID: Unique identifier for each research session or cycle.

Problem Statement: The key question or problem to be addressed.

Key Findings: Summaries of relevant research or insights.

Prioritized Questions: Primary questions generated for Planning to address.

Next Stage Link: Links directly to the Planning Table, ensuring smooth data transfer to the next stage.

2. Planning Table (Orange Triangle)

Purpose: To organize and track strategic planning and logistical frameworks.

Fields:

Plan ID: Unique identifier for each plan iteration.

Linked Research Insights: Key findings from the Research stage, pulled from the Research Table.

Action Plan: Detailed steps and timelines based on research priorities.

Resource Dependencies: Information on what will be needed for Development.

Next Stage Link: Links directly to the Development Table for seamless data flow.

3. Development Table (Yellow Triangle)

Purpose: To capture creative solutions, prototypes, and experimental results.

Fields:

Prototype ID: Identifier for each prototype or idea tested.

Planning References: Action plans or logistics carried over from the Planning Table.

Prototype Description: Details about the prototype or creative output.

Test Results: Observations or metrics gathered during initial testing.

Next Stage Link: Links directly to the Budget Table for easy reference.

4. Budget Table (Green Triangle)

Purpose: To document budget allocations, financial projections, and resource plans.

Fields:

Budget ID: Identifier for each budgeting process.

Linked Development Data: Prototype data or requirements from the Development Table.

Budget Allocation: Summary of funding and resources assigned.

Cost-Benefit Analysis: Financial projections and any constraints.

Next Stage Link: Links to the Market Table to provide necessary resource context.

5. Market Table (Blue Triangle)

Purpose: To plan communication, marketing, and engagement with the target audience.

Fields:

Market ID: Unique identifier for each marketing effort.

Budget Data Reference: Financial constraints or allocations from the Budget Table.

Target Audience: Definition and details of the intended audience.

Marketing Strategy: Description of marketing or communication plans.

Next Stage Link: Directs to the Support Table to carry through messaging insights.

6. Support Table (Purple Triangle)

Purpose: To track feedback, support insights, and final reflections that will inform the next cycle.

Fields:

Support ID: Identifier for each feedback session or support cycle.

Linked Market Data: References from the Market Table to understand the context of the outreach.

Feedback Collected: Summary of feedback or support insights gathered.

Refinement Goals: Adjustments recommended for the next cycle.

Next Cycle Link: Connects directly to the Research Table for the start of the new iteration.

Inter-Table Linkages and Data Flow

Each table will be linked sequentially (Research → Planning → Development → Budget → Market → Support), ensuring that each stage receives the exact data it needs from the prior stage. The Support Table will complete the cycle by linking back to the Research Table, enabling the feedback loop for the next iteration.

Would you like to add specific data entry fields or automated features in each table to optimize data transfer and ensure data continuity?

You said:

Yes there must be specific data entry fields and automated features in each table

ChatGPT said:

To enhance each table with specific data entry fields and automated features, here's a refined structure that ensures data flows smoothly between stages, minimizes manual input, and leverages automated tools for data consistency. I'll also include suggested automations for each table that could be triggered by integrations (like Make.com) or native Airtable automation features.

Detailed Table Structure with Data Entry Fields and Automation

1. Research Table (Red Triangle)

Fields:

Research ID: Unique identifier for each cycle's research phase.

Problem Statement: Text field for the main question or issue under investigation.

Key Findings: Summary of primary insights and relevant data from initial research.

Prioritized Questions: List or multi-select field for the high-priority questions identified for Planning.

Next Stage Prepared (Checkbox): Checkbox to confirm completion of research and readiness to hand off to Planning.

Date Completed: Date field for when Research phase is marked complete.

Planning Link: Linked Record to Planning Table for easy data transition.

Automation:

Trigger: When Next Stage Prepared is checked.

Action: Automatically create a linked record in the Planning Table, copying the Problem Statement and Key Findings fields.

2. Planning Table (Orange Triangle)

Fields:

Plan ID: Unique identifier for each planning phase within a cycle.

Research Link: Linked Record to Research Table to pull through Problem Statement and Key Findings.

Action Plan: Checklist or multi-select field for steps to be completed in the Development phase.

Resource Requirements: Field for any dependencies or resources needed by Development.

Timelines & Deadlines: Date fields for planning timelines, completion targets, and deadlines.

Development Link: Linked Record to Development Table to pass along the finalized action plan.

Automation:

Trigger: When Timelines & Deadlines are entered.

Action: Generate a Development Table entry, automatically populating the Action Plan and Resource Requirements fields for Development's reference.

3. Development Table (Yellow Triangle)

Fields:

Prototype ID: Identifier for each prototype or initial solution generated.

Planning Reference: Linked Record to Planning Table for direct access to the Action Plan.

Prototype Description: Text field detailing the prototype or creative output.

Testing Data: Attachment field to upload test results or reports.

Prototype Status (Single Select): Options like "In Testing," "Pending Approval," or "Ready for Budget."

Budget Link: Linked Record to Budget Table to initiate financial assessment once prototype is ready.

Automation:

Trigger: When Prototype Status changes to "Ready for Budget."

Action: Create an entry in the Budget Table, transferring Prototype Description and Testing Data for budget review.

4. Budget Table (Green Triangle)

Fields:

Budget ID: Unique identifier for each budgeting instance.

Development Link: Linked Record to Development Table for details on the prototype in need of funding.

Allocated Budget: Currency field to specify financial support approved for the prototype.

Financial Constraints: Text field for any budget limitations or cost-cutting requirements.

Resource Allocation Checklist: Checklist field for tracking allocated resources.

Market Link: Linked Record to Market Table to pass on budget constraints and allocations.

Automation:

Trigger: When Allocated Budget is entered and marked as complete.

Action: Automatically populate a Market Table record, including Allocated Budget and Financial Constraints.

5. Market Table (Blue Triangle)

Fields:

Market ID: Identifier for each market strategy phase.

Budget Reference: Linked Record to Budget Table for budget details related to the prototype.

Target Audience: Text or multi-select field describing the intended audience.

Engagement Strategy: Detailed text field for the marketing or communication plan.

Key Performance Indicators (KPIs): Field for tracking KPIs such as reach, engagement rate, etc.

Support Link: Linked Record to Support Table to share KPIs and prepare for feedback collection.

Automation:

Trigger: When Engagement Strategy is finalized.

Action: Create a linked record in the Support Table, copying Target Audience and KPIs.

6. Support Table (Purple Triangle)

Fields:

Support ID: Identifier for each feedback and support phase.

Market Link: Linked Record to Market Table for context on the engagement strategy.

Feedback Summary: Long-text field for collating feedback received.

Performance Insights: Field to note any significant metrics or observations from the KPIs.

Recommendations for Next Cycle: Field summarizing suggested adjustments or new focus areas for the next cycle.

Research Link for Next Cycle: Linked Record to Research Table to start a new cycle with identified needs or challenges.

Automation:

Trigger: When Feedback Summary is completed.

Action: Generate a new Research Table entry for the next cycle, automatically populating Problem Statement with key insights or focus areas from Support.

Additional Automation and Integration Ideas

With Make.com or similar integrations, you can further enhance the automation by:

Sending notifications to relevant teams or agents as soon as each stage completes.

Connecting external tools like Google Sheets for budget calculations or Google Docs for long-text analysis and automatically storing outputs in Airtable.

Generating summaries or reports from each stage's data, compiling insights and outputs from each table as a cycle concludes.

This setup supports a highly organized, interlinked system where each stage's outputs feed directly into the next, preserving data continuity while accommodating a variety of data types. Let me know if you'd like to explore specific integration details next!

You said:

Let's instead break this down further to 6 data bases, each with many tables, that way the databases flow into eachother instead of the tables.

ChatGPT said:

Creating six separate databases, each dedicated to a specific stage in the Cosmic Council workflow, is a powerful approach. This setup would give each stage the autonomy to handle its own multi-faceted data requirements while maintaining the inter-database flow needed to cascade information smoothly from one stage to the next.

Here's how we can structure this six-database system, with each database housing its own relevant tables. Each database will output data to the next stage's database, preserving the cascading flow of information in line with the ROYGBV sequence.

Database Structure by Stage

1. Research Database (Red Triangle)

Purpose: To gather, organize, and prioritize research insights that define the problem.

Tables:

Core Problem: Stores the main question or issue being explored.

Literature Review: Contains summaries, notes, and sources from relevant research.

Key Findings: Highlights important insights that may influence the subsequent Planning phase.

Prioritized Questions: Lists high-priority questions that will guide Planning.

Research Summary: A compiled output of key findings and priority questions, formatted for transfer to the Planning Database.

Automation:

Output: When Research Summary is complete, it automatically sends the finalized summary to the Planning Database.

2. Planning Database (Orange Triangle)

Purpose: To transform research findings into a structured action plan.

Tables:

Action Steps: Lists the main steps derived from the research for execution.

Resource Mapping: Identifies necessary resources, including personnel, materials, and tools.

Timeline and Milestones: Outlines deadlines, milestones, and dependencies.

Strategic Objectives: A table to detail the goals for Development based on research insights.

Planning Output: A consolidated view of action steps, resources, and timeline, prepped for transfer to the Development Database.

Automation:

Output: Upon completion, Planning Output sends its structured action plan and resource requirements to the Development Database.

3. Development Database (Yellow Triangle)

Purpose: To develop and test creative solutions based on the action plan.

Tables:

Prototypes: Contains descriptions, designs, and other details of initial prototypes or ideas.
Testing Results: Stores outcomes of testing phases, user feedback, and iteration notes.
Creative Notes: Contains brainstorming outcomes, design ideas, and documentation of the creative process.
Development Summary: Compiles successful prototypes and key findings from testing.
Resource Needs: Notes on any additional resource requirements for Budget.
Automation:

Output: The Development Summary and Resource Needs tables send data on finalized prototypes and resource requests to the Budget Database.

4. Budget Database (Green Triangle)

Purpose: To allocate and manage budget resources based on Development's needs.

Tables:

Budget Allocation: Specifies funds allotted to each prototype or project.
Cost Analysis: Calculates the cost-effectiveness and ROI of each prototype.
Resource Availability: Tracks material, human, and financial resources allocated.
Financial Constraints: Documents any limitations or adjustments needed for budget adherence.
Budget Output: Summary of allocations and constraints for Market's use.
Automation:

Output: When ready, Budget Output sends financial details and constraints directly to the Market Database.

5. Market Database (Blue Triangle)

Purpose: To develop market strategies and communication plans based on budgeted prototypes.

Tables:

Audience Targeting: Defines demographics, psychographics, and other key characteristics.
Engagement Plan: Outlines the marketing and communication strategy.
Market Analysis: Contains trends, consumer behaviors, and competitor insights.
KPIs: Lists key metrics for tracking success.
Market Output: Consolidates strategy and KPIs for the Support Database's monitoring.
Automation:

Output: Market Output is sent to the Support Database to prepare for implementation and feedback collection.

6. Support Database (Purple Triangle)

Purpose: To collect feedback, evaluate outcomes, and provide insights for the next iteration.

Tables:

User Feedback: Collects consumer, stakeholder, and internal feedback.
Performance Metrics: Tracks KPIs and assesses performance against Market objectives.
Support Recommendations: Gathers insights and suggestions for improvement.
Iteration Summary: Compiles feedback, insights, and goals for the next Research cycle.
Automation:

Output: Iteration Summary is sent to the Research Database to initiate the next cycle based on newly identified challenges and insights.

Inter-Database Automation and Data Flow

With the help of Make.com or similar integration tools, these databases can be linked as follows:

Inter-Database Transfers: Automations trigger upon completion of each stage, sending key outputs to the next database. This ensures that only essential, curated data flows forward, reducing data clutter and maintaining focus.

Feedback Integration: The Support Database's Iteration Summary loops back to the Research Database, completing the cycle and preserving insights for the new problem statement.

Versioning and History: Each database's output table (e.g., Research Summary, Planning Output) will retain historical records of past cycles, enabling continuity, reference, and analysis across iterations.

This structure organizes data by stage and keeps each database self-contained, focusing on its unique actions and outputs while supporting seamless data handoffs to the next stage. Let me know if you'd like to dive deeper into any specific database or automation feature!

You said:

Very good! Now go back to the Red triangle so we can build out each table. Reference the above conversation and the knowledge base and ask me one question at a time before planning the database structure

ChatGPT said:

Starting with the Research Database (Red Triangle), our goal is to capture foundational insights, define the problem statement, and prioritize questions that will guide the next stages. I'll break this down step-by-step, asking questions to ensure we're aligned on the details.

First Question:

To effectively capture the Core Problem, we'll need a table that documents the main question or issue being addressed for each cycle.

Should the Core Problem focus on a single primary question per cycle, or would you like to capture multiple sub-questions that break down the issue more granularly?

You said:

The process should only address one problem at a time but if other problems arise during the process, it should be noted and sent to the last stage for support that way all problems will be addressed eventually. The last stage is a bit like the HR department listening to the concerns from each department.

ChatGPT said:

Perfect—that makes sense. So the Core Problem table in the Research Database will capture one main problem per cycle, keeping focus streamlined. Any additional issues that arise during Research will be noted and passed to the Support Database at the end of the cycle, where they can be reviewed and prioritized for future iterations.

Next Question:

In addition to capturing the main problem statement in this table, do you envision needing specific fields to track context or background information? This could include details about why the problem is significant or any initial observations relevant to the problem.

You said:

Yes, absolutely. The more specific the better the problem will be understood and addressed.

ChatGPT said:

Got it! Including detailed context and background information will give a well-rounded view of the problem, helping future stages to build on a fully informed foundation.

Research Database: Core Problem Table - Initial Structure

Based on this, here's how we can begin structuring the Core Problem table:

Problem ID: Unique identifier for each problem in the cycle, ensuring traceability.

Main Problem Statement: Field to capture the core question or issue.

Context: Detailed notes on why this problem is significant, including any triggering events or conditions.

Initial Observations: Field to note any early insights or patterns observed during preliminary research.

Next Question:

For tracking purposes, would you like to capture the date the problem was identified and/or the team or agent responsible for submitting the problem? This would support transparency and accountability, especially if multiple agents are involved in initiating research.

You said:

Yes to both

ChatGPT said:

Great! Including both the date identified and responsible agent fields will add clarity on timing and accountability.

Revised Core Problem Table Structure

Here's how the Core Problem table is shaping up:

Problem ID: Unique identifier.

Main Problem Statement: The central question or issue of the cycle.

Context: Background details explaining why the problem is significant.

Initial Observations: Early insights or patterns noted.

Date Identified: Date the problem was officially recorded.

Submitted By: Agent or team responsible for bringing the problem forward.

Next Question:

When we think about documenting the Research Findings that will support the Core Problem, do you prefer these to be summarized at a high level, or should each piece of research have its own detailed entry (e.g., source, author, summary, relevance to the problem)? This could help future stages understand the depth and sources behind the research.

You said:

Each piece of research should have its own detailed entry

ChatGPT said:

Excellent! Having a detailed entry for each piece of research will create a rich knowledge base, allowing future stages to drill down into specific sources or insights if needed.

Research Database: Research Findings Table Structure

Here's an outline for the Research Findings table that will capture each piece of research with relevant details:

Finding ID: Unique identifier for each research entry.

Source: The origin of the research (e.g., article, book, study).

Author: Name(s) of the researcher(s) or author(s).

Date of Publication: Date the research was published or released.

Summary: Brief overview of the research content.

Relevance to Problem: Notes on how this research connects to or informs the Core Problem.

Keywords/Tags: Keywords or tags that highlight major themes (e.g., methodology, industry-specific terms).

Date Added: Date the research was added to the database for traceability.

Next Question:

Would you like to include fields for rating or scoring each research piece based on factors like credibility, relevance, or impact? This could help prioritize research findings when they're referenced in future stages.

You said:

yes

ChatGPT said:

Adding rating fields for credibility, relevance, and impact will help prioritize research findings, making it easier for future stages to reference the most valuable insights.

Updated Research Findings Table Structure

Here's the refined structure for the Research Findings table with rating fields:

Finding ID: Unique identifier.

Source: The origin of the research (e.g., article, book, study).

Author: Researcher(s) or author(s).

Date of Publication: Publication date.

Summary: Overview of the research content.

Relevance to Problem: Explanation of how this finding informs the Core Problem.

Keywords/Tags: Major themes or topics.

Date Added: Date the entry was added to the table.

Credibility Rating: Rating or score for credibility (e.g., 1-5).

Relevance Rating: Rating or score for relevance to the Core Problem.

Impact Rating: Rating or score for the potential impact of the findings on the solution.

Next Question:

Would you like to add a notes section for any additional observations or reflections that don't fit into the structured fields? This could allow agents to record thoughts or insights that come up during their analysis.

You said:

yes

ChatGPT said:

Including a notes section will give agents the flexibility to add any supplementary insights or reflections that don't fit into other fields, enhancing the depth of each research entry.

Finalized Research Findings Table Structure

Here's the complete layout for the Research Findings table:

Finding ID: Unique identifier.

Source: Origin of the research (e.g., article, book, study).

Author: Researcher(s) or author(s).

Date of Publication: Publication date.

Summary: Overview of the research content.

Relevance to Problem: How this finding connects to the Core Problem.

Keywords/Tags: Major themes or topics.

Date Added: Date the entry was added.

Credibility Rating: Rating for credibility (e.g., 1-5).

Relevance Rating: Rating for relevance.

Impact Rating: Rating for potential impact.

Notes: Space for additional observations or reflections.

Next Step:

With Core Problem and Research Findings tables taking shape, the next consideration is the Prioritized Questions that will guide the Planning phase.

Question: For the Prioritized Questions table, do you envision each question being linked back to specific research findings that support it? This could strengthen the foundation of each question and make it easier for the Planning stage to understand its basis.

You said:

yes that would be helpful

ChatGPT said:

Linking each prioritized question back to specific research findings will create a strong foundation for the Planning stage, as it will provide direct context for why each question was chosen.

Research Database: Prioritized Questions Table Structure

Here's an outline for the Prioritized Questions table, including fields that link each question to relevant research findings:

Question ID: Unique identifier for each question.

Question Text: The full text of the prioritized question guiding Planning.

Supporting Research Links: Linked Record to Research Findings table, connecting each question to specific research entries that support its relevance.

Importance Rating: Score indicating the priority level of the question (e.g., high, medium, low).

Relevance to Core Problem: Explanation of how this question aligns with or addresses the Core Problem.

Date Added: Date when the question was added to the list.

Next Question:

Would you like to include a category or theme field for each question to help group similar questions? For example, themes could be based on subtopics within the Core Problem, helping the Planning stage see patterns or clusters of questions more easily.

You said:

Go back to the Research Findings Table. We need to set up the field types

ChatGPT said:

Let's define the specific field types for the Research Findings table to ensure clarity and consistency. Each field type will align with the nature of the data it captures, making it easy to input and reference information.

Research Findings Table: Field Types

Finding ID: Auto-number — Automatically assigns a unique ID to each entry for easy tracking.

Source: Single Line Text — Brief text field to enter the origin of the research, like an article title, book name, or report.

Author: Single Line Text — To capture the name(s) of the researcher(s) or author(s).

Date of Publication: Date — For entering the publication date of the research.

Summary: Long Text — A larger text field to provide a brief overview of the research content.

Relevance to Problem: Long Text — To describe how this finding relates to the Core Problem.

Keywords/Tags: Multiple Select — Allows selection of multiple keywords or themes (e.g., methodology, key terms) for easy categorization.

Date Added: Date — To mark when the research finding was entered into the table, providing a timeline.

Credibility Rating: Single Select (e.g., 1-5) — A dropdown to rate credibility, with options for scores such as 1 (low) to 5 (high).

Relevance Rating: Single Select (e.g., 1-5) — A dropdown to assess relevance to the Core Problem, with scores like 1 (low) to 5 (high).

Impact Rating: Single Select (e.g., 1-5) — A dropdown for potential impact, with ratings from 1 (low) to 5 (high).

Notes: Long Text — For any additional observations, thoughts, or supplementary information. This structure allows each research entry to be detailed, categorized, and prioritized, making it an effective resource for subsequent stages. Would you like to move on to field types for the Core Problem table next, or add more customization to the Research Findings table?

You said:

Break down the Prioritized Questions table with field types

ChatGPT said:

Here's a detailed breakdown of the Prioritized Questions table, including appropriate field types to capture the necessary information:

Prioritized Questions Table: Field Types

Question ID: Auto-number — Automatically generates a unique identifier for each question to keep them organized and trackable.

Question Text: Long Text — A larger text field for entering the full text of each prioritized question, providing room for detailed phrasing.

Supporting Research Links: Linked Record (to Research Findings table) — Links each question to relevant entries in the Research Findings table. This helps track which research findings support each question.

Importance Rating: Single Select (e.g., High, Medium, Low) — A dropdown to indicate the priority level of the question, helping the Planning stage to identify high-priority areas for focus.

Relevance to Core Problem: Long Text — A descriptive field for outlining how this question addresses or connects to the Core Problem. This adds context for the next stages, showing why the question is important.

Date Added: Date — To record when the question was added to the table, enabling timeline tracking for each cycle.

Category/Theme: Multiple Select — Allows categorization by themes or subtopics within the Core Problem (e.g., technical, logistical, ethical), making it easier for Planning to spot patterns or clusters of related questions.

This setup ensures that each question is well-supported, easy to understand, and ready for strategic planning. Would you like to add any additional fields, or is this structure complete for your needs?

You said:

List the Category/Themes

ChatGPT said:

Here are some suggested Category/Theme options for the Prioritized Questions table. These themes are broad enough to apply across various problems while still giving structure to the types of questions that may arise within the Research stage:

Technical: Questions focused on technical aspects, such as system requirements, capabilities, or scientific challenges.

Logistical: Questions addressing operational or procedural aspects, including timelines, workflows, or resource dependencies.

Ethical: Questions centered on moral or ethical considerations, such as fairness, societal impact, or potential consequences.

Resource-Based: Questions about resource availability, allocation, or management (e.g., budget constraints, human resources, materials).

Strategic: Questions related to overall strategy or high-level planning, which may influence decision-making in later stages.

User-Centric: Questions focused on user needs, experience, or feedback, ensuring solutions are relevant and accessible to end users.

Feasibility: Questions addressing the practicality or viability of proposed solutions, including potential obstacles or limitations.

Innovation/Creativity: Questions that explore novel ideas, creative approaches, or opportunities for unique solutions.

Impact Assessment: Questions focused on assessing or measuring the impact of potential solutions, whether financial, social, or environmental.

Compliance/Regulatory: Questions concerning legal or regulatory requirements, ensuring adherence to relevant laws or standards.

These themes will help agents quickly recognize the focus areas for each question, enhancing the workflow in the Planning stage. Would you like to add any other themes or adjust any of these?

You said:

Let's work on the Core Problem table.

ChatGPT said:

Great! Let's build out the Core Problem table to capture all the essential information needed to define and contextualize the main problem of each cycle. Here's an initial structure:

Core Problem Table: Proposed Fields and Field Types

Problem ID: Auto-number — A unique identifier for each problem, providing easy reference for each cycle.

Main Problem Statement: Long Text — The primary field for documenting the central question or issue the cycle will address. This should capture the problem in as much detail as possible.

Context: Long Text — A detailed background field explaining why the problem is significant, including circumstances or events that make it important to address. This helps to ensure the next stages understand the problem's relevance and urgency.

Initial Observations: Long Text — Space for preliminary insights or observations noted by agents in Research, adding early perceptions about the problem that might be relevant for further exploration.

Date Identified: Date — Tracks the date when the problem was officially recorded, helping to keep a timeline of the research process.

Submitted By: Single Select or Linked Record — A dropdown or linked field to indicate the agent, team, or department responsible for submitting the problem. This provides accountability and allows the next stages to follow up if needed.

Associated Themes: Multiple Select — Allows for tagging with themes (e.g., Technical, Logistical, Ethical), similar to those used in the Prioritized Questions table. This categorization helps with later reference and ensures the problem is approached from the correct perspective in future stages.

Problem Status: Single Select (e.g., New, In Review, Ready for Planning) — A field to show the current status of the problem, ensuring everyone in the workflow is clear on the problem's readiness for transfer to the Planning stage.

Next Question:

Would you like to add a severity or priority rating to this table? This could help indicate the level of importance or urgency of each problem, which might influence how it's addressed in Planning and beyond.

You said:

List the Associated Themes

ChatGPT said:

Here are suggested Associated Themes for the Core Problem table. These themes mirror the types of categories that might shape the context of a problem, giving the Planning stage a clear sense of the focus areas to consider.

Associated Themes

Technical Constraints: Challenges related to technology, infrastructure, or capabilities that limit the scope of potential solutions.

Operational/Logistical Issues: Problems related to processes, workflows, or the logistics of implementing solutions.

Ethical Considerations: Moral, ethical, or societal concerns that the problem presents, guiding thoughtful and responsible decision-making.

Resource Limitations: Issues stemming from limited resources, such as funding, human capital, or materials.

Strategic Goals: Problems connected to high-level objectives or organizational goals, indicating that the issue affects overall strategy.

User Experience (UX): Problems that impact the user experience, indicating a need for solutions focused on accessibility, usability, or satisfaction.

Feasibility Challenges: Constraints around practicality or viability, suggesting potential obstacles that may need to be overcome.

Innovation Needs: Areas where creative or innovative solutions are required, encouraging the team to think outside conventional approaches.

Regulatory Compliance: Problems arising from legal, compliance, or regulatory requirements, which will need adherence to standards or policies.

Impact Assessment: Issues that affect measurable outcomes, such as financial, environmental, or social impact, highlighting the importance of assessing solution effectiveness.

These themes will help categorize each problem's context, clarifying for each stage what perspectives to prioritize. Would you like to add or modify any themes?

You said:

You asked:

Would you like to add a severity or priority rating to this table? This could help indicate the level of importance or urgency of each problem, which might influence how it's addressed in Planning and beyond.

yes

ChatGPT said:

Adding a Severity/Priority Rating will help indicate the level of urgency or importance, providing essential guidance for the Planning stage on how much attention and resources the problem might require.

Updated Core Problem Table Structure with Severity/Priority Rating

Problem ID: Auto-number — Unique identifier for each problem.

Main Problem Statement: Long Text — Detailed description of the primary question or issue.

Context: Long Text — Background details on why the problem is significant.

Initial Observations: Long Text — Preliminary insights or observations on the problem.

Date Identified: Date — Date when the problem was recorded.

Submitted By: Single Select or Linked Record — Agent or team responsible for submitting the problem.

Associated Themes: Multiple Select — Tags for problem themes (e.g., Technical Constraints, User Experience, etc.).

Severity/Priority Rating: Single Select — Options such as:

High: Immediate attention required; the problem has major implications or potential impact.

Medium: Important but not urgent; requires attention in the current cycle.

Low: Minimal immediate impact but relevant for long-term planning or lower-priority cycles.

Problem Status: Single Select (e.g., New, In Review, Ready for Planning) — Current progress stage of the problem.

Next Step:

This gives the Core Problem table a comprehensive structure. Would you like to add any further fields, or shall we move on to the next table within the Research Database?

You said:

Next table please

ChatGPT said:

The next table in the Research Database is the Research Findings table, where we'll capture each piece of research relevant to the Core Problem. This table will serve as a repository of detailed entries, helping to support a well-informed foundation for subsequent stages.

Here's the structure we discussed, with field types included to ensure detailed tracking and prioritization of each finding.

Research Findings Table: Field Structure and Types

Finding ID: Auto-number — Unique identifier for each research entry.

Source: Single Line Text — The origin of the research, such as an article title, book name, or report.

Author: Single Line Text — Name(s) of the researcher(s) or author(s).

Date of Publication: Date — The publication or release date of the research material.

Summary: Long Text — Overview of the research content, providing context and relevance.

Relevance to Problem: Long Text — Explanation of how this research connects to the Core Problem.

Keywords/Tags: Multiple Select — Keywords or topics for easy categorization, e.g., methodology, industry, technology.

Date Added: Date — The date this research finding was added to the database.

Credibility Rating: Single Select (e.g., 1-5) — Rating the source's credibility, from 1 (low) to 5 (high).

Relevance Rating: Single Select (e.g., 1-5) — Rating the relevance of the finding to the Core Problem.

Impact Rating: Single Select (e.g., 1-5) — Rating the potential impact of the research on shaping the solution.

Notes: Long Text — Additional observations, reflections, or details not covered by other fields.

Next Question:

Do you need a field for attachments (e.g., PDF files, images, or links) to store actual documents or visuals associated with each research entry? This can make it easy to access the full research source directly from the table.

You said:

yes

ChatGPT said:

Including an Attachments field will allow direct access to full research documents, visuals, or links, making it easier to review complete sources when needed.

Finalized Research Findings Table Structure

Here's the complete layout for the Research Findings table with the Attachments field included:

Finding ID: Auto-number — Unique identifier for each research entry.

Source: Single Line Text — The origin of the research, such as an article title, book name, or report.

Author: Single Line Text — Name(s) of the researcher(s) or author(s).

Date of Publication: Date — The publication or release date of the research material.

Summary: Long Text — Overview of the research content, providing context and relevance.

Relevance to Problem: Long Text — Explanation of how this research connects to the Core Problem.

Keywords/Tags: Multiple Select — Keywords or topics for categorization.

Date Added: Date — The date this research finding was added to the database.

Credibility Rating: Single Select (e.g., 1-5) — Rating the source's credibility, from 1 (low) to 5 (high).

Relevance Rating: Single Select (e.g., 1-5) — Rating the relevance of the finding to the Core Problem.

Impact Rating: Single Select (e.g., 1-5) — Rating the potential impact of the research on shaping the solution.

Notes: Long Text — Additional observations, reflections, or details.

Attachments: Attachment — For PDFs, images, or links to original research documents.

Next Step:

This completes the Research Findings table setup. Would you like to move on to the Prioritized Questions table next?

You said:

How many tables will we have for the Research Database?

ChatGPT said:

For the Research Database, we'll likely need three main tables to fully support the Research stage's functions. Here's a breakdown:

Core Problem Table: Captures and defines the primary problem for each cycle, including context, initial observations, and priority.

Research Findings Table: Houses detailed entries for each piece of research related to the Core Problem, including summaries, ratings, and attachments.

Prioritized Questions Table: Documents the key questions derived from the research findings, which will guide the Planning stage.

This setup provides a structured approach to capturing the Core Problem, supporting research, and actionable questions generated from the research phase. If any additional data-tracking needs arise, such as tracking research sources or keeping notes on team discussions, we could consider adding supplementary tables, but these three are likely sufficient to cover the core needs of the Research stage.

Would you like to move on to building out the Prioritized Questions Table now?

You said:

Now that we have established these three tables, list all the fields again for each of them and how they will connect. Describe how they flow into each other through links and automations.

ChatGPT said:

Here's a detailed look at each of the three tables in the Research Database along with their fields, connections, and how they flow into each other through links and automations.

1. Core Problem Table

Purpose: This table captures the main problem or question for the current cycle, along with essential context, initial observations, and priority ratings.

Fields:

Problem ID (Auto-number): Unique identifier for each problem.

Main Problem Statement (Long Text): Central question or issue to address in this cycle.

Context (Long Text): Background and significance of the problem.

Initial Observations (Long Text): Early insights or notes about the problem.

Date Identified (Date): Date when the problem was recorded.

Submitted By (Single Select or Linked Record): Agent or team responsible for identifying the problem.

Associated Themes (Multiple Select): Tags for key themes (e.g., Technical, Ethical, User Experience).

Severity/Priority Rating (Single Select): Urgency level (e.g., High, Medium, Low).

Problem Status (Single Select): Tracks progress, e.g., "New," "In Review," "Ready for Planning."

Connections:

To Research Findings Table: Each problem links to research findings that help define or explore the problem.

Automation:

Once the Problem Status is marked "In Review," the database triggers a prompt for researchers to start populating the Research Findings table with relevant research.

2. Research Findings Table

Purpose: A repository for individual pieces of research related to the Core Problem, allowing detailed tracking of each source's credibility, relevance, and impact.

Fields:

Finding ID (Auto-number): Unique identifier for each research entry.

Source (Single Line Text): Title or origin of the research material.

Author (Single Line Text): Name(s) of researcher(s) or author(s).

Date of Publication (Date): When the research was published.

Summary (Long Text): Brief overview of the research content.

Relevance to Problem (Long Text): How this finding informs the Core Problem.

Keywords/Tags (Multiple Select): Key topics, themes, or methods covered in the research.

Date Added (Date): Date the entry was added to the table.

Credibility Rating (Single Select): Rating from 1 to 5 on the source's credibility.

Relevance Rating (Single Select): Rating from 1 to 5 on relevance to the Core Problem.

Impact Rating (Single Select): Rating from 1 to 5 on potential impact.

Notes (Long Text): Additional observations or comments.

Attachments (Attachment): PDFs, images, or links to original documents.

Connections:

Links to Core Problem Table: Each finding links to a specific problem, providing context on how it supports or addresses the Core Problem.

To Prioritized Questions Table: Key research findings are linked to specific questions in the next table, grounding each question in research-based evidence.

Automation:

When a research finding's Relevance Rating is marked as 4 or 5, it triggers a recommendation prompt to add related questions in the Prioritized Questions Table for Planning.

3. Prioritized Questions Table

Purpose: This table organizes the critical questions derived from research findings that will guide the next stage, Planning. Each question is supported by research evidence and aligned with the Core Problem.

Fields:

Question ID (Auto-number): Unique identifier for each question.

Question Text (Long Text): Full text of the prioritized question.

Supporting Research Links (Linked Record to Research Findings Table): Connects each question to specific research findings that support it.

Importance Rating (Single Select): Level of priority (e.g., High, Medium, Low).

Relevance to Core Problem (Long Text): Explanation of how the question aligns with or addresses the Core Problem.

Date Added (Date): Date the question was added to the database.

Category/Theme (Multiple Select): Themes (e.g., Technical, Strategic, User-Centric) to help categorize questions.

Connections:

Links to Research Findings Table: Each question is supported by one or more research findings, grounding it in data and insights.

Links to Core Problem Table: Each question aligns back to the Core Problem, ensuring that it remains relevant to the initial issue.

Automation:

When a question is marked as High Priority, an alert is triggered for review, preparing it for transfer to the Planning Database.

Once a cycle's prioritized questions are completed, an automation creates a summary report of questions and related research findings, which can be sent to the Planning team.

Flow and Automation Summary

Core Problem → Research Findings:

After the Core Problem is defined and marked "In Review," researchers begin populating relevant entries in the Research Findings Table.

Research findings are linked back to the Core Problem, connecting each piece of research to the issue it helps address.

Research Findings → Prioritized Questions:

When research findings are identified as highly relevant (Relevance Rating of 4 or 5), they are linked to new or existing questions in the Prioritized Questions Table.

This table houses all questions that the Planning stage will address, grounded in specific research evidence.

Prioritized Questions → Next Stage (Planning Database):

Once all relevant questions are collected and reviewed, a final summary report is generated, automatically populated with linked questions and related findings.

This report is then transferred to the Planning Database, where the next team will use it to inform action plans and strategies.

This setup ensures that the flow between tables is systematic and automated, with each stage building directly on the data and insights from the previous step. Let me know if you'd like to explore or adjust any part of this workflow!

Help me set up the links and automations

ChatGPT said:

To set up the links and automations for the Research Database, we'll configure connections between the tables, and set up automated workflows to trigger when certain conditions are met. Here's a step-by-step guide for each of the key links and automations:

Step 1: Linking Tables

1. Linking Core Problem Table to Research Findings Table

Purpose: To associate each research finding with the Core Problem it addresses.

Setup:

In the Research Findings Table, create a new field titled Linked Problem.

Set this field type to Linked Record and link it to the Core Problem Table.

This will allow researchers to select the specific Core Problem each finding addresses.

Use Case: When a new research entry is added to the Research Findings Table, the researcher links it to the relevant Core Problem.

2. Linking Research Findings Table to Prioritized Questions Table

Purpose: To connect each prioritized question with supporting research findings.

Setup:

In the Prioritized Questions Table, create a new field titled Supporting Research Links.

Set this field type to Linked Record and link it to the Research Findings Table.

This will allow you to select one or multiple research entries that support each prioritized question.

Use Case: When a question is created, you can link it to specific research findings that provide evidence or context.

3. Linking Prioritized Questions Table to Core Problem Table

Purpose: To maintain context by linking each question back to the Core Problem it addresses.

Setup:

In the Prioritized Questions Table, add a field titled Associated Problem.

Set this field type to Linked Record and link it to the Core Problem Table.

This link will allow each question to be associated with the Core Problem, ensuring continuity of focus throughout the cycle.

Use Case: When new questions are generated, they are linked to the relevant Core Problem to indicate their focus.

Step 2: Configuring Automations

Automation 1: Trigger Research Stage Workflow

Purpose: To alert researchers to begin populating the Research Findings Table once a problem is marked "In Review."

Setup:

Go to Automations in Airtable and create a new automation.

Trigger: Set the trigger to watch for changes in the Core Problem Table where Problem Status changes to "In Review."

Action: Add a notification action that sends a message (either through email or Airtable notification) to the research team, prompting them to start adding research findings related to the problem.

Use Case: This automation activates once the problem is ready for further investigation, signaling the start of the research process.

Automation 2: Recommend Adding Questions Based on Relevant Research Findings

Purpose: To prompt agents to create prioritized questions when a research finding is rated highly relevant.

Setup:

In Automations, create a new automation.

Trigger: Set this to trigger when a new record is added to the Research Findings Table with a Relevance Rating of 4 or 5.

Action: Send a notification or prompt to the agent responsible for question generation, recommending that they review this finding and consider adding a corresponding question to the Prioritized Questions Table.

Use Case: When key findings with high relevance are added, this automation encourages agents to develop questions based on the strongest evidence.

Automation 3: High-Priority Question Alert for Planning

Purpose: To highlight high-priority questions for the Planning stage.

Setup:

Go to Automations and create a new automation.

Trigger: Set it to trigger when the Importance Rating field in the Prioritized Questions Table is set to "High."

Action: Create an alert or notification that prompts Planning team members to review this question in detail. This could also generate a summary entry in the Planning Database or create a report.

Use Case: Ensures that high-priority questions receive attention when passed on to the Planning stage.

Automation 4: Generate a Summary Report for the Planning Team

Purpose: To consolidate all prioritized questions and associated research findings once the Research stage is complete.

Setup:

Trigger: Set the trigger to activate when all questions in the Prioritized Questions Table for the current cycle have an Importance Rating and are linked to research findings.

Action: Use Airtable's "Create record" action to generate a summary in a dedicated Summary Report Table (or send an email or message to the Planning team).

Report Fields: Pull in fields like Question Text, Supporting Research Links, and Importance Rating.

Use Case: Prepares a clear summary of Research stage outputs for Planning, making it easy to transition to the next phase.

Summary of Workflow and Automation Flow

Core Problem Table: Once a problem is marked "In Review," Automation 1 prompts researchers to begin populating research findings.

Research Findings Table: As new findings with a high relevance rating (4 or 5) are added, Automation 2 encourages agents to generate related questions in the Prioritized Questions Table.

Prioritized Questions Table: When a question is marked "High" in Importance Rating, Automation 3 alerts the Planning team to prioritize this question.

End of Research Stage: Automation 4 compiles a summary report of prioritized questions and links to research findings, ready for transfer to the Planning Database.

These links and automations ensure smooth data flow between tables and streamline transitions from the Research stage to the next stage. Let me know if you'd like to refine any part of this setup or add additional customizations!

You said:

Wait, we need to set up another field? Why not use the Source field?

ChatGPT said:

You're absolutely correct! We can streamline by using the Source field in the Research Findings Table to directly capture the origin or main source of the research, rather than setting up a redundant linking field for connecting to the Core Problem.

Let's refine the structure based on this simplification:

Adjusted Setup for Links and Automations Without Additional Fields

Core Problem Table → Research Findings Table

Connection: Instead of creating a separate Linked Problem field, researchers will use the existing Source field in the Research Findings Table to document the origin of each research piece. They will continue to link each Research Finding directly to the Core Problem it supports in the Relevance to Problem field.

Benefit: This keeps the database cleaner, reducing unnecessary fields while still allowing context for each research piece.

Revised Automation Summary with Simplified Fields

Core Problem to Research Findings Automation:

When a problem status changes to "In Review," this triggers an alert for researchers to start adding research findings. Researchers add findings with their Source and Relevance to Problem documented.

Research Findings to Prioritized Questions Automation:

Research findings with high Relevance Rating trigger an automation to prompt agents to generate related questions in the Prioritized Questions Table.

Prioritized Questions to Planning Automation:

When a question's Importance Rating is marked as "High," this triggers an alert for prioritization in the next stage.

End of Research Summary Automation:

A final summary compiles the Prioritized Questions and associated Research Findings for the Planning stage.

This adjustment streamlines the tables without adding unnecessary fields, leveraging the Source and Relevance to Problem fields effectively. Thanks for catching that! Let me know if you'd like any further adjustments.

You said:

One thing at a time please. Lets set up 1 automation

ChatGPT said:

Understood! Let's start by setting up the first automation for the Research Database.

Automation 1: Triggering the Research Workflow When a Problem is Ready

Objective: To notify researchers to begin adding relevant findings once a Core Problem is marked "In Review," signaling that the research phase is ready to start.

Step-by-Step Setup for Automation 1 in Airtable

Go to Automations:

Open the Core Problem Table in Airtable.

Click on the Automations tab and select Create an automation.

Set the Trigger:

Choose When a record matches conditions as the trigger type.

Configure the trigger conditions:

Table: Core Problem Table

Condition: Set Problem Status to "In Review."

This will ensure that the automation only activates when a Core Problem is officially ready for the research process.

Create an Action:

Add an action to Send a notification to the research team.

Choose Email or Airtable Notification depending on your preference.

For an Airtable Notification:

Message: Write a message such as: "The Core Problem [Problem ID] has been marked as 'In Review.' Please begin populating the Research Findings Table with relevant entries."

Notify: Select the research team members who should receive this notification.

For an Email Notification:

To: Add the email addresses of the research team.

Subject: "New Research Phase Initiated for Problem [Problem ID]"

Body: Write a message like: "The Core Problem [Problem ID]: [Main Problem Statement] has entered the 'In Review' phase. Please start adding relevant research findings that support this problem."

Test the Automation:

Click Test to ensure the automation triggers correctly. It should notify the research team whenever a problem's status changes to "In Review."

Turn On the Automation:

Once testing is successful, click Turn On to activate the automation.

This automation will now automatically notify researchers to begin work on the Research Findings Table as soon as a Core Problem is marked "In Review."

Would you like to proceed with setting up the next automation?

You said:

I want this to stay inside Airtable. which record should it update?

ChatGPT said:

If we want this automation to stay entirely within Airtable and update a record instead of sending an external notification, we can have it create or update a record in the Research Findings Table to signal researchers to start adding relevant entries.

Automation 1: Updating a Record in the Research Findings Table

Objective: When a problem in the Core Problem Table is marked as "In Review," this automation will create a new record in the Research Findings Table. This entry will serve as a prompt or placeholder for researchers to begin adding findings related to that Core Problem.

Step-by-Step Setup for Automation 1

Go to Automations:

Open the Core Problem Table in Airtable.

Go to the Automations tab and select Create an automation.

Set the Trigger:

Choose When a record matches conditions.

Configure the trigger conditions:

Table: Core Problem Table

Condition: Set Problem Status to "In Review."

This will ensure the automation activates only when a Core Problem is ready for research.

Create an Action to Add a Record in Research Findings:

Choose Create a record as the action type.

Table: Set this to the Research Findings Table.

Map the fields to provide context:

Problem ID: Insert the Problem ID from the Core Problem Table.

Relevance to Problem: Set a note like "Core Problem marked as 'In Review.' Begin adding research findings."

Source: Optionally, you could put "Prompt" or "New Research Needed" as the source.

Date Added: Set to the current date using Airtable's date function.

Test the Automation:

Click Test to ensure that a new placeholder entry is created in the Research Findings Table when a Core Problem is marked as "In Review."

Turn On the Automation:

Once testing is successful, click Turn On to activate the automation.

This setup will automatically create an entry in the Research Findings Table to act as a prompt for researchers. They'll see the Problem ID and Relevance to Problem field filled in, signaling that it's time to start adding research findings relevant to this Core Problem.

Let me know if you'd like to continue with additional automations!

You said:

I cant select the Problem ID because it is autogenerated. Should this be changed to a single line text?

ChatGPT said:

If the Problem ID is an auto-generated field, Airtable won't allow it to be directly referenced or used in automations since it's based on an internal numbering system. Here's how to address this:

Option 1: Change Problem ID to a Single Line Text field:

You can manually input unique identifiers or structured IDs (like "Prob-001") in a text format, allowing them to be referenced in automations.

This solution gives you flexibility for referencing Problem ID across tables and automations.

Note: This requires you or the team to manually enter or copy the identifier for each new problem.

Option 2: Add a new Single Line Text field in Core Problem Table specifically for automations.

You can name this field something like Problem Reference ID and manually enter identifiers (e.g., "Prob-001").

This field can then be used to link records in automations.

Note: This is a good alternative if you want to keep Problem ID as an auto-number while adding a manually editable field for reference.

Recommendation: Using Option 2 (adding a Problem Reference ID field) allows you to retain the auto-numbered Problem ID for internal tracking while still giving you a flexible, editable field for automations.

Would you like help setting up the Problem Reference ID field and configuring the automation accordingly?

You said:

yes I need help with that part

ChatGPT said:

Let's set up the Problem Reference ID field in the Core Problem Table and adjust the automation to use this field.

Step 1: Create the Problem Reference ID Field

In the Core Problem Table:

Add a new field and name it Problem Reference ID.

Set the field type to Single Line Text.

In this field, you'll manually enter unique identifiers for each problem (e.g., "Prob-001," "Prob-002," etc.).

This ID will now be available for use in automations and linking to other tables.

Step 2: Adjust the Automation to Use Problem Reference ID

Now that the Problem Reference ID field is set up, we'll configure the automation to use it.

Set Up the Automation Trigger:

Go to the Automations tab in Airtable.

Choose When a record matches conditions as the trigger type.

Configure the trigger conditions:

Table: Core Problem Table

Condition: Problem Status is set to "In Review."

Create the Action to Add a Record in Research Findings:

Set the action type to Create a record.

Table: Select the Research Findings Table.

Fields to Map:

Problem Reference ID: Insert the Problem Reference ID from the Core Problem Table.

Relevance to Problem: Add a note such as "Core Problem marked as 'In Review.' Begin adding research findings."

Source: Optionally add "Prompt" or "New Research Needed" as the source to indicate this is a placeholder for new research.

Date Added: Set to the current date (you can use Airtable's date function here).

Test the Automation:

Run a test to verify that when a problem's Problem Status is set to "In Review," a new entry is created in the Research Findings Table using the Problem Reference ID.

Activate the Automation:

Once the test is successful, activate the automation by turning it on. With this setup, each time a problem is marked "In Review," a new record with the Problem Reference ID is created in the Research Findings Table, signaling researchers to start adding findings related to that specific Core Problem.

Let me know if there's anything further you'd like to refine!

You said:

I don't want to manually enter problem IDs. Why can't they be autogenerated and linked?

ChatGPT said:

If you'd prefer to have Problem IDs auto-generated and still use them in links and automations, Airtable offers a way to do this by combining fields. We can create an auto-generated Problem Reference ID by using a Formula field based on the auto-numbered Problem ID and, optionally, other details. This method allows for an automatically generated, unique identifier that's usable in automations and links without manual entry.

Setting Up an Auto-Generated Problem Reference ID with a Formula
Create an Auto-Numbered Problem ID Field (If Not Already Set)

If you haven't done so, ensure that Problem ID is set as an Auto-number field. This field generates a sequential number for each new problem.
Create the Problem Reference ID Using a Formula Field

In the Core Problem Table, add a new field and name it Problem Reference ID.
Set the field type to Formula.

Use a formula to combine the Problem ID with any prefix or additional context you want, like this:

arduino

Copy code

"Prob-" & {Problem ID}

This formula will create a unique identifier such as "Prob-1," "Prob-2," etc., automatically updating with each new record.

Use Problem Reference ID in Automations and Links

Now that Problem Reference ID is generated by the formula, it can be referenced in automations, links, or any other fields as a static text string.

Example: Updating the Automation with Auto-Generated Problem Reference ID

Adjust the Automation to Use Problem Reference ID

In your automation settings:

Set the Trigger to activate when Problem Status is changed to "In Review."

For Create a record in the Research Findings Table, set the Problem Reference ID field in the Research Findings Table to pull in this auto-generated Problem Reference ID.

Test and Activate the Automation:

Test the setup to ensure that each time a Core Problem's status is updated to "In Review," the automation creates a linked entry in the Research Findings Table using the auto-generated Problem Reference ID.

With this approach, you'll have an automatically created Problem Reference ID that's consistent and usable across tables without any manual data entry. Let me know if you'd like any further customization!

You said:

Lets move on to building the tables in the Logistics Database

ChatGPT said:

Great! Moving on to the Logistics Database (Orange Triangle), this database will support the Planning stage by organizing and structuring actionable plans, resource needs, and timelines based on the information provided by the Research stage.

Logistics Database: Overview of Key Tables

In this database, we'll focus on capturing details that will prepare the next stage (Development) with a clear roadmap. Here are the proposed tables:

Action Plan Table: Contains the main steps and strategic objectives derived from prioritized questions and research findings.

Resource Mapping Table: Tracks resource needs, such as personnel, materials, and tools required for each action plan.

Timeline & Milestones Table: Outlines project timelines, key milestones, and dependencies to ensure a structured workflow.

Each table will link to relevant items from the Research Database, especially the Prioritized Questions that have been generated to guide the Planning stage.

Let's start with the Action Plan Table and set it up step-by-step.

Action Plan Table

Purpose: To document the core actions, steps, and objectives derived from the Research stage, providing Development with a structured list of tasks.

Fields and Field Types

Action Plan ID (Auto-number): Unique identifier for each action plan entry.

Objective (Long Text): High-level objective that aligns with the prioritized questions and provides a goal for the Development stage.

Related Questions (Linked Record): Links to the Prioritized Questions table from the Research Database, providing context for why this action plan was created.

Detailed Steps (Long Text): A breakdown of specific actions required to achieve the objective.

Assigned Team or Agent (Single Select or Linked Record): Specifies who will be responsible for executing the action plan (e.g., team, department, or individual).

Priority Level (Single Select): Indicates urgency, with options like "High," "Medium," or "Low," helping Development prioritize tasks.

Dependencies (Linked Record to Resource Mapping Table): Links to specific resources or personnel needed for this action, ensuring that each step is supported.

Status (Single Select): Tracks the current status, with options like "Not Started," "In Progress," or "Completed."

Automation and Links

Automation 1: Automatically generate a record in the Resource Mapping Table for each new action that requires resources, copying over fields such as Objective and Priority Level.

Linking Fields: Related Questions will be linked to the Prioritized Questions Table in the Research Database, while Dependencies will link to the Resource Mapping Table within the Logistics Database.

Would you like to set up the Resource Mapping Table next, or explore further automations within the Action Plan Table?

You said:

Well hold on, The Green Triangle needs to focus on time and resources

ChatGPT said:

You're absolutely right! Since the Green Triangle (Budget and Resources) will handle detailed budgeting, resource allocation, and time management, the Logistics Database (Orange Triangle) for the Planning stage should focus specifically on strategic action steps and task dependencies without overlapping with budgeting or time allocation.

With that in mind, here's how we can adjust our approach for the Logistics Database to focus on action planning and operational dependencies, while leaving resource and timeline specifics for the Green Triangle.

Adjusted Logistics Database Structure

In this revised structure, we'll keep the focus on defining clear objectives, action steps, and dependencies needed for successful handoff to the Development stage.

Proposed Tables for Logistics Database

Action Plan Table: Documents actionable steps and strategic objectives based on the prioritized questions from Research.

Dependency Mapping Table: Identifies necessary dependencies for each action plan, such as key personnel, specific tools, or knowledge areas, without getting into detailed resources or budgeting.

Let's start by refining the Action Plan Table to reflect this streamlined purpose.

Action Plan Table

Purpose: To capture high-level action plans and objectives, providing a roadmap for Development without delving into budgeting or specific resources.

Fields and Field Types

Action Plan ID (Auto-number): Unique identifier for each action plan entry.

Objective (Long Text): A high-level objective

You said:

There needs to be 3 tables each database

ChatGPT said:

Understood! Each database will follow a three-table structure. For the Logistics Database in the Orange Triangle, we'll keep a clear focus on creating actionable steps, identifying key dependencies, and ensuring alignment with the objectives set by the Research stage. Here's how the three tables in the Logistics Database can be organized:

1. Action Plan Table

Purpose: To define strategic objectives, capture actionable steps, and clarify the purpose of each plan as it moves toward Development.

Fields and Field Types

Action Plan ID (Auto-number): Unique identifier for each action plan entry.

Objective (Long Text): The high-level goal of the plan that aligns with the Core Problem.

Related Questions (Linked Record): Links to Prioritized Questions from the Research Database, grounding the plan in research-derived questions.

Action Steps (Long Text): A detailed breakdown of each step required to achieve the objective.

Assigned Team or Role (Single Select or Linked Record): Specifies who is responsible for executing each part of the action plan.

Priority Level (Single Select): Options such as "High," "Medium," or "Low," for prioritizing steps as they move to Development.

Dependencies (Linked Record to Dependency Mapping Table): Links to specific dependencies documented in the Dependency Mapping Table.

Status (Single Select): Tracks progress, with statuses like “Not Started,” “In Progress,” or “Completed.”

Automation

Prompt Dependency Creation: When a new action plan is created, an automation prompts the creation of entries in the Dependency Mapping Table to identify key dependencies.

2. Dependency Mapping Table

Purpose: To document critical dependencies for each action plan, including key personnel, specific tools, or knowledge areas that Development will rely on.

Fields and Field Types

Dependency ID (Auto-number): Unique identifier for each dependency.

Action Plan Reference (Linked Record to Action Plan Table): Links to the related action plan that requires this dependency.

Dependency Type (Single Select): Type of dependency, such as “Personnel,” “Equipment,” or “Knowledge.”

Dependency Description (Long Text): Detailed description of the dependency, including specifics like required skills, tools, or materials.

Criticality Level (Single Select): Importance of the dependency (e.g., Critical, Important, Optional).

Assigned Point of Contact (Single Line Text or Linked Record): Name or role of the individual responsible for securing or providing the dependency.

Automation

Link Dependencies to Action Plan: Automatically link new dependencies to their respective action plans, ensuring Development knows what’s required to proceed.

3. Strategic Objectives Table

Purpose: To ensure that the action plans remain aligned with overarching strategic goals, guiding the Development stage with a clear understanding of the desired outcome.

Fields and Field Types

Objective ID (Auto-number): Unique identifier for each strategic objective.

Objective Description (Long Text): A comprehensive description of the strategic goal aligned with the Core Problem.

Related Action Plans (Linked Record to Action Plan Table): Links the objective to specific action plans, ensuring that each action aligns with broader goals.

Success Criteria (Long Text): Key criteria for determining the success of each objective.

Status (Single Select): Tracks current alignment, with options like “In Progress” or “Achieved.”

Evaluation Notes (Long Text): Space for adding any observations or adjustments recommended for Development.

Automation

Sync Objectives and Action Plans: Automatically link each action plan to a related objective, ensuring that each plan is aligned with the overarching goal.

Flow Between Tables

Action Plan Table → Dependency Mapping Table: Each action plan links to its dependencies, which document essential personnel, tools, or knowledge areas for Development.

Action Plan Table → Strategic Objectives Table: Each action plan is linked to a high-level strategic objective, providing context on how the action supports the overall mission.

Dependency Mapping Table → Development Stage: Dependencies identified in this table will help Development know which tools, personnel, or knowledge areas are essential to fulfill the action plan.

This structure keeps each table focused and aligned, providing Development with a clear, actionable roadmap from the Planning stage. Let me know if you'd like to adjust any details or set up automations for specific steps!

You said:

Look over what you just wrote and find overlaps or redundancies

ChatGPT said:

You're absolutely right to check for overlaps and redundancies. Let's refine the structure to make sure each table has a unique role without duplicating information. After reviewing, here are some adjustments:

Combine Strategic Objectives and Action Plan Tables:

The Strategic Objectives Table largely overlaps with the Action Plan Table since both focus on objectives, criteria, and steps for achieving the goal. We can streamline by merging the Strategic Objectives into the Action Plan Table as additional fields, which will avoid duplicating entries and make the table more comprehensive.

Refine Fields in the Action Plan Table:

With the objective-related fields incorporated into the Action Plan Table, we'll reduce redundancy by clarifying that each Action Plan entry covers the high-level goal, specific steps, and success criteria.

We'll also move Success Criteria and Status into this unified table, clarifying the overall progress of each plan.

Adjust Dependency Mapping Table to Focus Exclusively on Essential Requirements:

Dependency Mapping will solely capture dependencies without referencing objectives, ensuring its role is distinct and focused on operational needs.

Refined Structure for the Logistics Database

With these adjustments, here's the streamlined structure:

1. Action Plan Table (Combined with Strategic Objectives)

Purpose: To document strategic objectives, specific steps, and success criteria, providing Development with a detailed roadmap.

Fields and Field Types

Action Plan ID (Auto-number): Unique identifier for each action plan.

Objective (Long Text): High-level goal aligned with the Core Problem.

Related Questions (Linked Record to Prioritized Questions in Research Database): Links to the prioritized questions that inspired the action plan.

Action Steps (Long Text): Detailed steps required to achieve the objective.

Success Criteria (Long Text): Defines what success looks like for each action plan, including measurable outcomes.

Assigned Team or Role (Single Select or Linked Record): Specifies who is responsible for executing the plan.

Priority Level (Single Select): Indicates urgency (e.g., High, Medium, Low).

Dependencies (Linked Record to Dependency Mapping Table): Links to the Dependency Mapping Table to document essential personnel, tools, or materials.

Status (Single Select): Tracks the current status, with options such as “Not Started,” “In Progress,” or “Completed.”

Automation

Prompt Dependency Creation: When a new action plan is created, an automation prompts the creation of dependencies in the Dependency Mapping Table.

2. Dependency Mapping Table

Purpose: To document critical dependencies (e.g., personnel, tools, or knowledge areas) needed for each action plan.

Fields and Field Types

Dependency ID (Auto-number): Unique identifier for each dependency.

Action Plan Reference (Linked Record to Action Plan Table): Links the dependency to the specific action plan it supports.

Dependency Type (Single Select): Type of dependency (e.g., “Personnel,” “Equipment,” “Knowledge”).

Dependency Description (Long Text): Detailed explanation of the dependency, including requirements.

Criticality Level (Single Select): Importance of the dependency (e.g., Critical, Important, Optional).

Assigned Point of Contact (Single Line Text or Linked Record): Specifies the individual responsible for securing or providing the dependency.

Automation

Link Dependencies to Action Plan: Automatically link new dependencies to their action plans, ensuring Development has what’s needed to proceed.

3. Evaluation Notes Table (New Table for Feedback and Adjustments)

Purpose: To capture observations, feedback, or potential adjustments after the Planning stage, providing Development with insights on adjustments or refinements to keep in mind.

Fields and Field Types

Evaluation ID (Auto-number): Unique identifier for each evaluation entry.

Related Action Plan (Linked Record to Action Plan Table): Links to the action plan being evaluated.

Feedback Notes (Long Text): Detailed notes on feedback or improvements suggested.

Recommended Adjustments (Long Text): Specific suggestions for changes to the plan before Development starts.

Date of Evaluation (Date): Date the evaluation feedback was recorded.

Updated Flow Between Tables

Action Plan Table → Dependency Mapping Table: Each action plan links to its dependencies, which detail personnel, tools, or knowledge areas needed.

Action Plan Table → Evaluation Notes Table: As each action plan is finalized, evaluative notes are added to provide Development with insights.

Dependency Mapping Table → Development Stage: All dependencies are documented and linked, ready for use in the Development stage.

This refined structure keeps each table focused and removes redundancy while capturing objectives, steps, and dependencies clearly. Let me know if you'd like to dive into any specific automations for this setup!

You said:

Zoom out. Think about the whole structure of the hexagonal workflow, each triangle of the hexagon is a database having three triangular sections within (tables). What are the most important tables for each?

ChatGPT said:

Absolutely—taking a step back to focus on the entire hexagonal structure will ensure each database is purposefully designed within the Cosmic Council's workflow. Each triangle in the hexagon represents a stage in the ROYGBV workflow, and each stage is a database with three essential tables that capture the most important components for that stage.

Here's a streamlined look at each database (triangle) and its three key tables:

1. Red Triangle (Research Database)

Core Problem Table: Captures the main problem or question for the cycle, including context and significance.

Research Findings Table: Repository of detailed research entries that provide evidence and insights related to the Core Problem.

Prioritized Questions Table: Holds key questions derived from research findings, which guide the Planning stage.

Purpose: To define the problem, gather insights, and identify actionable questions for further exploration.

2. Orange Triangle (Logistics Database)

Action Plan Table: Outlines high-level objectives and detailed steps required to address the prioritized questions.

Dependency Mapping Table: Documents the critical dependencies (e.g., personnel, tools, knowledge) needed to execute each action plan.

Evaluation Notes Table: Holds feedback or observations on the action plan before it moves into Development, offering refinements for the next stage.

Purpose: To create a structured, actionable plan and map dependencies, preparing a roadmap for the Development phase.

3. Yellow Triangle (Development Database)

Prototype Table: Stores designs, drafts, or prototypes developed to address the objectives from the Logistics stage.

Testing Results Table: Captures outcomes from initial testing phases, user feedback, and iteration notes for each prototype.

Creative Notes Table: Holds brainstorming outputs, design ideas, and reflections that inform the development of the final prototype.

Purpose: To transform plans into tangible solutions through prototyping and initial testing.

4. Green Triangle (Budget and Resource Database)

Budget Allocation Table: Tracks financial allocations for each project, prototype, or solution in development.

Resource Inventory Table: Lists materials, tools, and personnel available or required, ensuring all resources are accounted for.

Time and Cost Analysis Table: Assesses the cost-effectiveness, time requirements, and feasibility of each solution in progress.

Purpose: To allocate financial and physical resources effectively, keeping Development aligned with budget constraints.

5. Blue Triangle (Market Dynamics and Communication Database)

Audience Targeting Table: Defines target audience segments, including demographics, psychographics, and other audience data.

Engagement Strategy Table: Outlines the marketing and communication strategies tailored to the target audience, including key messaging.

Performance Metrics Table: Tracks KPIs and engagement metrics to assess the success of the communication and market engagement efforts.

Purpose: To create an effective communication plan and evaluate the market impact of the proposed solution.

6. Purple Triangle (Support and Feedback Database)

User Feedback Table: Collects feedback from users, stakeholders, and internal teams on the implemented solution.

Performance Assessment Table: Reviews how well the solution met its objectives, based on KPIs and other success criteria.

Continuous Improvement Table: Documents suggested refinements and additional issues identified, feeding insights back into the Research stage for the next cycle.

Purpose: To gather feedback, evaluate effectiveness, and identify areas for future improvement.

Summary of Each Triangle's Focus

Each triangle's three tables allow it to focus on its unique purpose:

Red (Research): Define the problem, gather insights, create guiding questions.

Orange (Logistics): Formulate actionable plans and map dependencies.

Yellow (Development): Design, test, and iterate on solutions.

Green (Budget and Resource): Allocate resources and ensure financial feasibility.

Blue (Market Dynamics and Communication): Plan engagement strategies and evaluate market impact.

Purple (Support and Feedback): Collect feedback, assess performance, and drive continuous improvement.

This structure supports a coherent, flowing data process that retains focus while allowing each stage to build on the work of the previous. Let me know if you'd like to set up a specific database or further refine any table!

You said:

Are there any overlaps in this structure? Would anything else be more effective?

ChatGPT said:

Looking closely, we can identify some potential overlaps and areas for refinement in the structure. Here are key adjustments that could streamline the workflow, reduce redundancy, and make the data flow more effective:

1. Combine Evaluation and Feedback Functions

The Evaluation Notes Table in the Orange Triangle (Logistics) and the Performance Assessment Table in the Purple Triangle (Support and Feedback) both focus on reviewing, assessing, and improving outcomes.

Suggestion: Move the Evaluation function entirely to the Purple Triangle, centralizing feedback and performance review in one stage. This would allow the Orange Triangle to focus solely on planning, with final evaluations and improvement suggestions housed in Purple.

2. Integrate Resource Planning Across Orange and Green Triangles

Both the Dependency Mapping Table in the Orange Triangle (Logistics) and the Resource Inventory Table in the Green Triangle (Budget and Resource) address resource needs, albeit from different perspectives (planning vs. availability).

Suggestion: Consolidate resource planning in the Green Triangle. Instead of mapping dependencies in the Orange Triangle, add fields for dependencies in the Green Triangle's Resource Inventory Table. This way, Orange can simply identify what resources are required, and Green handles tracking availability and allocation.

3. Refine Feedback Collection and User Testing in Yellow and Purple Triangles

The Testing Results Table in the Yellow Triangle (Development) and the User Feedback Table in the Purple Triangle (Support and Feedback) both gather input from users, which can overlap.

Suggestion: Move user-focused feedback entirely to the Purple Triangle. This allows the Yellow Triangle's Testing Results table to focus on technical testing and prototype iteration. User testing, which informs the broader impact and satisfaction, would be housed in Purple for a cohesive view of end-user insights.

4. Combine Audience Targeting and Engagement Strategy in Blue Triangle

The Audience Targeting Table and Engagement Strategy Table in the Blue Triangle (Market Dynamics and Communication) could be combined. Both tables capture aspects of communicating with the target audience.

Suggestion: Create a single Communication Strategy Table with fields for audience segmentation, key messaging, and specific engagement strategies. This would reduce redundancy while maintaining a comprehensive view of market engagement.

Revised Hexagonal Structure

Here's an optimized structure that reduces overlap and increases clarity:

1. Red Triangle (Research Database) – Focused on Problem Definition

Core Problem Table: Main problem statement, context, significance.

Research Findings Table: Detailed research entries.

Prioritized Questions Table: Actionable questions for Planning.

2. Orange Triangle (Logistics Database) – Focused on Planning Actionable Steps

Action Plan Table: Objectives, steps, priority, assigned roles.

Dependencies Identified Table: Lists resources, skills, or knowledge areas needed for action plans.

Related Questions Table: Pulls related questions from Research to keep focus on plan relevance.

3. Yellow Triangle (Development Database) – Focused on Solution Design and Internal Testing

Prototype Table: Design drafts, concepts, or prototypes.

Internal Testing Table: Technical and performance testing data.

Creative Notes Table: Brainstorming ideas and design reflections.

4. Green Triangle (Budget and Resource Database) – Focused on Financial and Resource Allocation

Budget Allocation Table: Financial allocations for each prototype or solution.

Resource Inventory Table: Available resources, including materials, tools, and personnel.

Time and Cost Analysis Table: Analyzes cost-effectiveness and time requirements.

5. Blue Triangle (Market Dynamics and Communication Database) – Focused on Audience Engagement

Communication Strategy Table: Consolidated audience targeting, key messaging, and strategies.

Market Insights Table: Data on trends, competitor analysis, consumer behavior.

Performance Metrics Table: KPIs to evaluate engagement success.

6. Purple Triangle (Support and Feedback Database) – Focused on User and Stakeholder Feedback

User Feedback Table: Collects user or stakeholder feedback post-launch.

Performance Assessment Table: Reviews how well the solution met objectives, based on KPIs.

Continuous Improvement Table: Documents suggestions for refinement or issues for next cycle's Research.

Benefits of This Revised Structure

Clearer Stages: Each triangle now has a distinct purpose without overlapping functions.

Centralized Feedback: Purple Triangle handles all evaluations, making it easier to analyze performance comprehensively.

Streamlined Resource Allocation: Resource planning is centralized in the Green Triangle, making it the one-stop stage for resource availability and allocation.

Combined Communication: Audience targeting and engagement strategies are combined in the Blue Triangle, providing a holistic view of external communication efforts.

This streamlined setup reduces redundancies, clarifies each triangle's function, and ensures each stage builds on the prior work more cohesively. Let me know if this aligns better with your goals or if there are any other areas to refine!

You said:

Keep in mind the order of these tables is important too. This should be a 3 step process. one table feeds into the next

ChatGPT said:

Absolutely, keeping each triangle's tables in a sequential, 3-step flow is key to maintaining an efficient workflow. Here's the refined structure where each table in a triangle is organized to feed directly into the next, ensuring a clear progression:

1. Red Triangle (Research Database) – Problem Definition Flow

Core Problem Table: Defines the main problem, providing background, context, and significance.

Research Findings Table: Collects detailed research insights related to the Core Problem, linking each finding back to the problem statement.

Prioritized Questions Table: Distills actionable questions from research findings, ready to guide the Planning stage.

Order and Flow: Core Problem → Research Findings → Prioritized Questions

Purpose: Starts with defining the issue, gathers insights, and outputs guiding questions for the Orange Triangle.

2. Orange Triangle (Logistics Database) – Planning and Structuring

Related Questions Table: Pulls prioritized questions from Research, ensuring that each action aligns with research-derived questions.

Action Plan Table: Uses Related Questions to develop high-level objectives and action steps, structuring them into a clear plan.

Dependencies Identified Table: Outlines critical resources, personnel, or knowledge areas required to execute each action plan.

Order and Flow: Related Questions → Action Plan → Dependencies Identified

Purpose: Starts by confirming goals from Research, structures actionable steps, and ends with identifying what's required for Development.

3. Yellow Triangle (Development Database) – Solution Design and Testing

Prototype Table: Develops initial drafts, designs, or solutions based on the action plans from Logistics.

Internal Testing Table: Conducts technical and performance testing on prototypes, documenting results and iterating as needed.

Creative Notes Table: Records brainstorming, design ideas, and reflections to inform further iterations or refinements.

Order and Flow: Prototype → Internal Testing → Creative Notes

Purpose: Starts with prototyping, tests for performance, and ends with notes on improvements or next steps.

4. Green Triangle (Budget and Resource Database) – Resource and Financial Allocation

Resource Inventory Table: Tracks available resources, personnel, and tools needed for Development.

Budget Allocation Table: Assigns financial resources for each project or prototype based on available inventory.

Time and Cost Analysis Table: Evaluates the cost-effectiveness and time requirements of each prototype or solution.

Order and Flow: Resource Inventory → Budget Allocation → Time and Cost Analysis

Purpose: Starts with resource availability, moves to financial allocation, and ends with a final feasibility check.

5. Blue Triangle (Market Dynamics and Communication Database) – Engagement Strategy

Market Insights Table: Gathers data on trends, consumer behaviors, and competitor analysis to inform engagement.

Communication Strategy Table: Builds an engagement plan with audience targeting, key messaging, and strategy based on Market Insights.

Performance Metrics Table: Establishes KPIs to track the success of the engagement plan and measure market impact.

Order and Flow: Market Insights → Communication Strategy → Performance Metrics

Purpose: Starts with research, crafts a strategy, and concludes with metrics to evaluate success.

6. Purple Triangle (Support and Feedback Database) – Evaluation and Continuous Improvement

User Feedback Table: Collects feedback from users and stakeholders on the implemented solution.

Performance Assessment Table: Analyzes feedback and compares it against KPIs to evaluate solution effectiveness.

Continuous Improvement Table: Documents suggestions for refinement, unresolved issues, and areas for the next Research cycle to address.

Order and Flow: User Feedback → Performance Assessment → Continuous Improvement

Purpose: Starts with feedback collection, moves to performance analysis, and ends with actionable insights for future improvements.

Summary of Flow

Red Triangle: Problem Definition – Defines, researches, and forms guiding questions.

Orange Triangle: Planning – Aligns objectives, creates action steps, and identifies dependencies.

Yellow Triangle: Development – Prototypes, tests, and refines.

Green Triangle: Resources and Budget – Checks resources, allocates budget, and analyzes feasibility.

Blue Triangle: Engagement – Analyzes the market, plans communication, and tracks success.

Purple Triangle: Feedback – Collects feedback, assesses performance, and plans for continuous improvement.

This 3-step progression in each triangle provides a clear, structured flow that moves purposefully through each stage of the workflow. Let me know if any specific details need further adjustment or if you'd like to dive into setting up automations between these steps!

You said:

Lets go back to the Orange Triangle. Set up the tables

ChatGPT said:

For the Orange Triangle (Logistics Database), we'll focus on transforming insights from the Research stage into actionable plans. Each table in the Orange Triangle will have a sequential role in guiding the Development stage. Here's how we'll structure these tables to follow the 3-step flow:

1. Related Questions Table

Purpose: This table pulls in prioritized questions from the Red Triangle's Research Database, ensuring that the planning phase directly addresses the questions that emerged from the research findings.

Fields and Field Types

Question ID (Linked Record to Prioritized Questions in Research Database): Links to each question from the Research Database.

Question Text (Long Text): Displays the full question text to provide context.

Objective Alignment (Single Select): A dropdown field to categorize how the question aligns with potential objectives (e.g., "Innovation," "Feasibility," "User Experience").

Priority Level (Single Select): Indicates the priority of the question (e.g., High, Medium, Low).

Status (Single Select): Tracks progress on the question, with options like "New," "Addressed," or "In Progress."

Automation

Prompt Action Plan Creation: When a question is marked as "Addressed," an automation prompts the creation of a corresponding entry in the Action Plan Table to begin planning action steps.

2. Action Plan Table

Purpose: Develops high-level objectives and detailed steps required to address each question from the Related Questions Table. This table provides a clear roadmap for the Development stage.

Fields and Field Types

Action Plan ID (Auto-number): Unique identifier for each action plan entry.

Related Question (Linked Record to Related Questions Table): Links each action plan to the relevant question it addresses.

Objective (Long Text): High-level goal for this action plan.

Action Steps (Long Text): Detailed breakdown of each step required to achieve the objective.

Assigned Team or Role (Single Select or Linked Record): Specifies who is responsible for carrying out each part of the action plan.

Priority Level (Single Select): Indicates urgency (e.g., High, Medium, Low).

Status (Single Select): Tracks progress with options like “Not Started,” “In Progress,” or “Completed.”

Automation

Trigger Dependency Mapping: When an action plan’s Status changes to “In Progress,” an automation prompts the creation of related dependencies in the Dependencies Identified Table.

3. Dependencies Identified Table

Purpose: Documents critical dependencies (such as personnel, tools, or knowledge areas) needed to carry out each action plan. This prepares the Development stage with all necessary resources and requirements.

Fields and Field Types

Dependency ID (Auto-number): Unique identifier for each dependency.

Action Plan Reference (Linked Record to Action Plan Table): Links to the action plan that requires this dependency.

Dependency Type (Single Select): Type of dependency (e.g., Personnel, Equipment, Knowledge).

Dependency Description (Long Text): Detailed description of the dependency.

Criticality Level (Single Select): Importance of the dependency (e.g., Critical, Important, Optional).

Assigned Point of Contact (Single Line Text or Linked Record): Name or role of the person responsible for securing or managing this dependency.

Automation

Notify Development: When all dependencies for an action plan are marked as “Confirmed,” an automation can alert the Development team that the action plan is ready for execution.

Summary of Table Flow

Related Questions Table: Receives prioritized questions from the Research Database and organizes them for planning.

Action Plan Table: Transforms questions into detailed action plans with specific objectives and steps.

Dependencies Identified Table: Lists essential dependencies for each action plan, ensuring Development has what it needs to proceed.

Workflow Automations Recap

From Related Questions to Action Plan: When a question is marked as “Addressed,” it triggers the creation of an action plan.

From Action Plan to Dependencies Identified: When an action plan status changes to “In Progress,” it prompts dependencies to be mapped.

Dependency Confirmation to Development Notification: When all dependencies are confirmed, it alerts Development that the action plan is ready for execution.

This structure ensures a streamlined, sequential flow from research insights to actionable steps, and then to identified dependencies, setting up the Development stage with everything it needs to proceed. Let me know if you’d like to adjust any details!

You said:

Lets move on to the Development Database

ChatGPT said:

For the Yellow Triangle (Development Database), we'll focus on transforming the planned action steps from the Orange Triangle (Logistics) into tangible solutions. This includes designing prototypes, conducting internal testing, and refining ideas based on initial results. Each table in the Development Database will play a sequential role, progressing toward a finalized prototype ready for budget review and resource allocation.

1. Prototype Table

Purpose: To house designs, drafts, and initial concepts that bring the action plans to life, based on the requirements and dependencies outlined in the Logistics Database.

Fields and Field Types

Prototype ID (Auto-number): Unique identifier for each prototype entry.

Related Action Plan (Linked Record to Action Plan Table in Logistics Database): Connects the prototype to the specific action plan it addresses.

Prototype Description (Long Text): Detailed description of the initial design or concept.

Design Stage (Single Select): Tracks the design stage (e.g., "Concept," "Draft," "Refined").

Assigned Designer or Team (Single Select or Linked Record): Specifies the person or team responsible for the prototype.

Date Created (Date): Date the prototype was created.

Status (Single Select): Tracks progress, with options like "In Progress," "Under Review," or "Complete."

Automation

Trigger Internal Testing: When a prototype status is marked as "Complete," an automation creates an entry in the Internal Testing Table to begin testing the prototype.

2. Internal Testing Table

Purpose: To test prototypes based on technical and performance criteria, documenting initial results and identifying areas for refinement before moving forward.

Fields and Field Types

Test ID (Auto-number): Unique identifier for each testing entry.

Prototype Reference (Linked Record to Prototype Table): Links the testing entry to the specific prototype being tested.

Testing Criteria (Multiple Select): Criteria used to evaluate the prototype (e.g., functionality, durability, usability).

Test Results (Long Text): Summary of the outcomes from testing, including successes and issues found.

Test Date (Date): Date the test was conducted.

Tested By (Single Select or Linked Record): Name or role of the person/team conducting the test.

Pass/Fail Status (Single Select): Indicates if the prototype met testing criteria (e.g., Pass, Fail, Needs Revision).

Automation

Notify for Revision: If a prototype fails testing, an automation sends a notification to update the Prototype Table with adjustments in the Creative Notes Table.

3. Creative Notes Table

Purpose: To document all brainstorming, ideas, and design reflections that emerge during the development process. This includes ideas for refinement based on testing results, helping to shape the final product.

Fields and Field Types

Note ID (Auto-number): Unique identifier for each creative note entry.

Prototype Reference (Linked Record to Prototype Table): Connects notes to a specific prototype.

Note Description (Long Text): Detailed note or idea related to improving or refining the prototype.

Origin of Idea (Single Select): Source of the idea (e.g., Testing Results, Team Brainstorm, User Feedback).

Date Added (Date): Date the note was recorded.

Implemented Status (Single Select): Tracks whether the idea has been implemented (e.g., "Pending," "In Progress," "Implemented").

Automation

Link to Testing Revisions: When a new note is marked as originating from testing, the system can auto-link it to the Internal Testing Table entry for clear documentation of changes made in response to test results.

Summary of Table Flow in Development Database

Prototype Table: Starts with the initial design or concept based on the Action Plan from the Logistics Database.

Internal Testing Table: Tests the prototype for performance, documenting results and noting any required changes.

Creative Notes Table: Collects ideas for refinement, tracking modifications or improvements inspired by testing.

Workflow Automations Recap

From Prototype to Internal Testing: When a prototype's status is set to "Complete," an entry is automatically created in the Internal Testing Table.

Testing Results to Creative Notes: If a prototype fails testing, this prompts a new entry in the Creative Notes Table to capture ideas for improvement.

Creative Notes to Prototype Update: When creative notes are implemented, they're linked back to update the status and description in the Prototype Table.

This structure ensures that the Development stage has a streamlined process, moving from design to testing and into refinement before final approval for budgeting and resources. Let me know if you'd like to set up a specific automation or modify any fields!

You said:

Lets move on to the Budget

ChatGPT said:

For the Green Triangle (Budget and Resource Database), we'll focus on managing resources, allocating budgets, and conducting a final feasibility check before moving to the Market Dynamics stage. This database ensures that all development projects have the necessary financial and material support to proceed.

Each table in the Budget and Resource Database will follow a logical progression, from tracking available resources to allocating budgets and analyzing time and cost factors.

1. Resource Inventory Table

Purpose: To keep a centralized list of available resources, including materials, tools, and personnel. This table provides an overview of all assets that can be allocated for development.

Fields and Field Types

Resource ID (Auto-number): Unique identifier for each resource.

Resource Name (Single Line Text): Description or name of the resource (e.g., "3D Printer," "UI Designer").

Resource Type (Single Select): Categorizes the resource (e.g., "Personnel," "Material," "Equipment").

Availability Status (Single Select): Indicates if the resource is "Available," "Reserved," or "Unavailable."

Assigned To (Linked Record to Prototype Table in Development Database): Links to any active projects using the resource.

Quantity or Units Available (Number): Amount of the resource available (for materials and equipment).

Location or Department (Single Line Text): Where the resource is housed or its managing department.

Automation

Resource Allocation Prompt: When a resource is assigned to a project, an automation updates the Availability Status to "Reserved," signaling that the resource is currently in use.

2. Budget Allocation Table

Purpose: To allocate and track funding for each project, including initial budgets, expenditures, and any adjustments needed as the project progresses.

Fields and Field Types

Budget ID (Auto-number): Unique identifier for each budget entry.

Related Prototype (Linked Record to Prototype Table in Development Database): Links to the specific prototype or project receiving the budget.

Initial Budget Amount (Currency): Original budget allocated to the project.

Current Expenditures (Currency): Tracks current spending for the project.

Remaining Balance (Formula): Calculates the difference between the Initial Budget Amount and Current Expenditures.

Budget Status (Single Select): Tracks the budget stage, with options like "Under Review," "Approved," or "Adjusted."

Notes on Adjustments (Long Text): Space for explaining any changes to the original budget.

Automation

Spending Update Notification: When Current Expenditures reach a certain threshold (e.g., 80% of the Initial Budget), an automation triggers a notification to review the budget allocation for potential adjustments.

3. Time and Cost Analysis Table

Purpose: To assess each project's cost-effectiveness and time requirements, ensuring that all financial and logistical considerations are in place before moving forward.

Fields and Field Types

Analysis ID (Auto-number): Unique identifier for each analysis entry.

Prototype Reference (Linked Record to Prototype Table in Development Database): Connects the analysis to the specific prototype or project being assessed.

Estimated Completion Time (Duration): Predicted time needed to complete the project.

Actual Completion Time (Duration): Tracks actual time taken once the project is completed.

Total Cost (Formula): Calculates the total cost, combining Initial Budget Amount and any additional costs noted in Budget Allocation.

Cost Efficiency Rating (Single Select): Rates cost-effectiveness (e.g., "High," "Moderate," "Low").

Feasibility Status (Single Select): Tracks the final feasibility of the project, with options like "Feasible," "Needs Adjustment," or "Not Feasible."

Recommendations (Long Text): Any final recommendations for adjustments, cutbacks, or added resources.

Automation

Feasibility Review Prompt: When Actual Completion Time exceeds the Estimated Completion Time or when Total Cost significantly exceeds the budget, an automation marks Feasibility Status as "Needs Adjustment" and prompts a review.

Summary of Table Flow in the Budget and Resource Database

Resource Inventory Table: Starts by tracking available resources, ensuring Development has what it needs to proceed.

Budget Allocation Table: Allocates funding for each project and tracks expenditures, making adjustments as necessary.

Time and Cost Analysis Table: Finalizes time and cost assessments, determining whether the project remains feasible or needs modifications.

Workflow Automations Recap

From Resource Inventory to Budget Allocation: When a resource is assigned to a prototype, the resource's availability is updated in the Resource Inventory Table.

Budget Allocation Spending Alert: As spending approaches the budget limit, a notification prompts review for potential adjustments.

Time and Cost Feasibility Check: When completion time or cost exceeds estimates, an automation triggers a feasibility review.

This setup in the Green Triangle ensures that all projects are properly resourced and financially sustainable before moving forward. Let me know if you'd like further customization or to proceed to the Blue Triangle!

Market

ChatGPT said:

For the Blue Triangle (Market Dynamics and Communication Database), the focus is on preparing for market engagement. This includes analyzing target audiences, planning communication strategies, and setting up metrics to measure success. The Blue Triangle's tables will follow a structured process, from understanding the market to defining engagement strategies and tracking performance.

Here's a setup for the Market Database:

1. Market Insights Table

Purpose: To gather and organize insights on market trends, competitor analysis, and consumer behavior, providing a foundational understanding for communication strategies.

Fields and Field Types

Insight ID (Auto-number): Unique identifier for each market insight entry.

Insight Type (Single Select): Categorizes insights (e.g., "Consumer Behavior," "Trend Analysis," "Competitor Analysis").

Insight Description (Long Text): Detailed description of the market insight or observation.

Source (Single Line Text or Linked Record): Source of the information, such as a research report, survey, or competitor data.

Relevance to Product (Single Select): Indicates how directly the insight applies to the current project, with options like “High,” “Moderate,” or “Low.”

Date Added (Date): Date the insight was recorded.

Actionable Insights (Long Text): Suggestions or recommendations based on the insight, guiding the Communication Strategy.

Automation

Strategy Prompt: When an insight’s Relevance to Product is marked “High,” an automation prompts the creation of a related entry in the Communication Strategy Table.

2. Communication Strategy Table

Purpose: To create a detailed plan for market engagement, including target audience segments, key messaging, and engagement channels, based on insights from the Market Insights Table.

Fields and Field Types

Strategy ID (Auto-number): Unique identifier for each strategy entry.

Related Market Insights (Linked Record to Market Insights Table): Links the strategy to relevant insights that inform it.

Target Audience (Single Select or Multiple Select): Specifies the intended audience segments, such as “Early Adopters,” “Millennials,” or “Small Businesses.”

Key Messaging (Long Text): Describes the primary message or value proposition communicated to the audience.

Engagement Channels (Multiple Select): Lists the channels to be used for engagement, such as “Social Media,” “Email,” or “Events.”

Planned Budget (Currency): Budget allocated for executing this strategy, linked to the Budget Database if needed.

Campaign Timeline (Date Range): Start and end dates for the campaign.

Status (Single Select): Tracks progress, with options like “Planned,” “In Progress,” or “Completed.”

Automation

Set Performance Metrics: When a new entry is created in the Communication Strategy Table, an automation creates a corresponding entry in the Performance Metrics Table to track success.

3. Performance Metrics Table

Purpose: To measure the effectiveness of each communication strategy, providing data on engagement, reach, and overall impact.

Fields and Field Types

Metric ID (Auto-number): Unique identifier for each metric entry.

Related Strategy (Linked Record to Communication Strategy Table): Links the metric to the specific communication strategy it measures.

Metric Type (Single Select): Type of performance metric, such as “Engagement Rate,” “Reach,” or “Conversion Rate.”

Target Metric Value (Number): The target or goal value for this metric, helping to set benchmarks.

Actual Metric Value (Number): The achieved value, allowing comparison against the target.
Performance Rating (Formula or Single Select): Formula or dropdown that assesses performance as “Exceeded,” “Met,” or “Below Target” based on target vs. actual metric values.
Feedback or Notes (Long Text): Space for observations, feedback, or notes on the campaign’s success or challenges.

Automation

Flag Underperformance: If Actual Metric Value is significantly below Target Metric Value, an automation flags the entry and sends a notification to review the strategy.

Summary of Table Flow in the Market Database

Market Insights Table: Starts with insights on market conditions, competitor behavior, and consumer trends, guiding strategic decisions.

Communication Strategy Table: Builds detailed engagement plans based on insights, focusing on target audiences and messaging.

Performance Metrics Table: Tracks the success of each communication strategy, measuring reach, engagement, and overall impact.

Workflow Automations Recap

From Market Insights to Communication Strategy: High-relevance insights automatically prompt the creation of a communication strategy entry.

From Communication Strategy to Performance Metrics: New strategies automatically trigger performance metric setup, ensuring tracking is in place before launch.

Flag for Underperformance: If performance metrics fall below targets, an alert prompts a review, allowing for strategy adjustments.

This setup provides a structured, data-driven approach to engage the market and assess communication success, aligning each strategy with data-backed insights. Let me know if you'd like further customization or to move on to the final stage—the Support and Feedback Database!

You said:

Support

ChatGPT said:

For the Purple Triangle (Support and Feedback Database), the goal is to gather insights from users, stakeholders, and internal teams about the solution’s effectiveness. This feedback loop is critical to the hexagonal workflow, as it identifies areas for improvement and drives continuous enhancement in future cycles.

Each table in the Support and Feedback Database will provide a clear pathway from feedback collection to performance evaluation and then to recommendations for continuous improvement, feeding insights back to the Research stage.

1. User Feedback Table

Purpose: To collect feedback from end users, stakeholders, and other relevant parties about their experience with the solution. This table captures direct input on functionality, usability, and overall satisfaction.

Fields and Field Types

Feedback ID (Auto-number): Unique identifier for each feedback entry.

Feedback Source (Single Select or Linked Record): Identifies the source of the feedback, such as “End User,” “Stakeholder,” or “Internal Team.”

Solution/Project Reference (Linked Record to Performance Assessment Table): Links to the specific solution or project being evaluated.

Feedback Summary (Long Text): A concise summary of the feedback received.

Feedback Details (Long Text): Detailed description of feedback, including any specific issues, likes, or suggestions.

Satisfaction Rating (Single Select): Rates overall satisfaction, with options like “Very Satisfied,” “Satisfied,” “Neutral,” “Dissatisfied,” and “Very Dissatisfied.”

Date Received (Date): Date when feedback was recorded.

Automation

Flag Low Satisfaction: When satisfaction is marked as “Dissatisfied” or “Very Dissatisfied,” an automation prompts a review in the Performance Assessment Table to investigate the issue further.

2. Performance Assessment Table

Purpose: To review feedback alongside key performance indicators, evaluating how well the solution met its objectives and identifying any areas for improvement.

Fields and Field Types

Assessment ID (Auto-number): Unique identifier for each assessment entry.

Related Solution/Project (Linked Record to User Feedback Table): Links the assessment to specific feedback entries.

Objective Alignment (Single Select): Indicates whether the solution met the main objectives, with options like “Fully Met,” “Partially Met,” or “Not Met.”

Overall Performance Rating (Single Select): Rates performance based on feedback and metrics (e.g., “Excellent,” “Good,” “Average,” “Poor”).

Key Issues Identified (Long Text): Lists any recurring issues or patterns noted during the review.

Improvement Areas (Multiple Select): Tags areas needing improvement, such as “Usability,” “Functionality,” “Efficiency,” or “User Experience.”

Assessment Date (Date): Date the performance assessment was completed.

Automation

Link Improvement Suggestions: When specific improvement areas are tagged, an automation prompts the creation of an entry in the Continuous Improvement Table to explore potential solutions.

3. Continuous Improvement Table

Purpose: To document actionable recommendations and specific improvements that can be implemented in the next cycle. This table feeds back into the Research stage, driving refinement and innovation.

Fields and Field Types

Improvement ID (Auto-number): Unique identifier for each improvement suggestion.

Linked Assessment (Linked Record to Performance Assessment Table): Connects to the assessment that identified the need for improvement.

Improvement Recommendation (Long Text): Detailed description of the recommended change or improvement.

Priority Level (Single Select): Importance of the improvement, with options like "High," "Medium," or "Low."

Implementation Status (Single Select): Tracks progress on the recommendation (e.g., "Pending," "In Progress," "Implemented").

Linked Problem for Next Cycle (Linked Record to Core Problem Table in Research Database): Links to the Core Problem Table for the next cycle if the recommendation requires new research or focus.

Notes on Outcome (Long Text): Observations on the effectiveness of the improvement if implemented.

Automation

Cycle Reset: When an improvement is marked as "Implemented," an automation links it back to the Core Problem Table in the Research Database, creating a new problem entry if it warrants further study.

Summary of Table Flow in the Support and Feedback Database

User Feedback Table: Collects direct feedback on the solution from users, stakeholders, or internal teams.

Performance Assessment Table: Evaluates feedback in relation to the solution's objectives, identifying strengths and areas needing improvement.

Continuous Improvement Table: Documents specific improvement recommendations and links them to the next Research cycle if they require further investigation.

Workflow Automations Recap

Flag Low Satisfaction for Review: When feedback shows low satisfaction, the system prompts a detailed review in the Performance Assessment Table.

Link Improvement Suggestions to Assessment: Key improvement areas identified in assessments automatically create entries in the Continuous Improvement Table.

Cycle Reset to Core Problem Table: When an improvement is implemented, it's linked back to the Research Database for consideration in the next problem-solving cycle.

This setup in the Purple Triangle closes the loop, providing a structured feedback and improvement process that informs the next cycle in the Cosmic Council's hexagonal workflow. Let me know if you'd like additional details on a specific table or automation!
